What would be the 'best case' resolution of NOAA's either or VIS / IR
or both.Another way of asking is what number of pixels do their sensors
use?Also while we are at it, what is 'best case' gray scale resolution?
Let mme e know if you can.Or perhaps direct me to a reliable source for
this info.
Thank you, reader!

The uplink and downlink are the same - 145.55. There's no set schedule as far as I know, they just transmit whenever their work schedule permits. I'm pretty sure that the 1200b packet station is almost always up. And for as long as I can remember (last couple of years), every cosmonaut aboard MIR is a ham. Watch this newsgroup and your local PBBS for info on who's on board and what call sign they are currently using.

Happy hunting and 73!

-Alan

You can work MIR on 145.55mhz.

Good luck and 73.

-Alan

Message-ID: <2qgn0m$hir@search01.news.aol.com>
Source record: 27536

In article <2qdll3$icm@post.its.mcw.edu>, mmjjmm@post.its.mcw.edu (Michael Malloy) writes:

*** Satellite tracking ***
<SatTrack v1.02>
Tracks one satellite across a world map as it moves, displays the instantaneous position of several satellites, or generates tables of all satellites visible from a certain location at a given time. Also calculates beam headings, Maidenhead grid locations, and MUFs. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

<MacSat v3.1>
Tracks up to 21 satellites simultaneously, either in simulation or real-time mode. Text screen displays ground-track coordinates, range, mean anomaly, visibility (azimuth and elevation) and Doppler shift frequency information for all satellites being tracked. Graphical screen portrays the satellite ground tracks superimposed on a world map. Polar plot displays graphically the precise location of each visible satellite above the observer's horizon. Developed by the Geodetic Research Laboratory of the University of New Brunswick. Available from Richard B. Langley, R.R. 12, Fredericton, N.B. E3B 6H7, Canada (Internet: lang@unb.ca). A demo version of MacSat may be ftp'ed from directory PUB.CANSPACE on unbmvs1.csd.unb.ca.
System 7

<OrbiTrack> <OrbiTrackFPU v2.1.4>
Calculates look angles to selected satellites, plots current satellite positions on a world map, and displays the visible passage of a satellite against background stars (either within the program itself or via a data file that can be read into the Voyager astronomy program). Please note that one version requires an FPU to operate! BEK Developers, P.O. Box 47114, St. Petersburg, FL 33743. (Bill Bard, CompuServe: 75366,2557) (Note: This replaces BEK's previous MacSat program, which was not related to the program of the same name from UNB.)

<QuikMac>
Macintosh version of N4HY's QuikTrak program. Requires Microsoft BASIC. AMSAT, P.O. Box 27, Washington, DC 20044.

<Satellite Orbit Prediction Program>
Macintosh conversion of W3IWI program. Requires Microsoft BASIC. Send formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015. Or send self-addressed stamped envelope for source listing.

<Satellite Pro>
Uses world maps and tables to indicate rising and setting schedules, current locations, mutual visibility opportunities, and footprints. Includes Mercator, polar, and great-circle displays. Optional antenna control. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98366.

<MacSPOC>

Dayton Hamvention '94 Termed "Best Ever" For AMSAT-NA

The 1994 Dayton Hamvention is now history, and AMSAT-North America's (AMSAT-NA) participation at this year's gathering was nothing short of a record breaker from a number of standpoints. "While all the numbers aren't in yet, we now believe this will be our best year ever for AMSAT at Dayton," said Bill Tynan (W3XO) AMSAT-NA President. He went on to express his sincere thanks for the very long hours, lost sleep and hard work put forth by the many Dayton AMSAT booth volunteers, forum speakers and contributors. In addition, Bill expressed his particular pleasure that the success at this year's Hamvention also coincided with AMSAT's 25th anniversary celebration. Without question, the highlight of this year's Hamvention activity was a forum honoring the 10th anniversary of SAREX activity aboard the NASA Space Shuttle. Roy Neal (K6DUE) moderated the forum and was joined on the podium by NASA Shuttle Astronauts Tony England (W0ORE) and Steve Nagel (N5RAW) along with several other members of the SAREX working group. Also joining the group by live telephone patch were Astronauts Jay Apt (N5QWL) at the Johnson Space Flight Center in Houston and Astronaut Ron Parise (WA4SIR) at the Goddard Space Flight Center in Greenbelt, Maryland. In addition, a surprisingly clear telephone patch was successfully completed to Astronaut Ken Cameron (KB5AWP) in Star City, Russia. Ken is now training there for an upcoming joint NASA/Soyuz mission to the Russian Space Station MIR. All the astronauts shared their on-orbit experiences with ham radio and answered several questions from the gathering of Hamvention attendees. A number of students who have contacted the Shuttle via Amateur Radio in the past were also present at the forum and gave their own first hand impressions of their activities. Local TV coverage from all three Dayton commercial television stations highlighted the NASA astronauts speaking to the standing-room-only crowd of nearly 500 present at the event.

Other AMSAT activities at this year's Hamvention included a beginner's forum hosted by Keith Baker (KB1SF) along with a new PACSAT forum hosted by John Hansen (WA0PTV). Ed Krome (KA9LNV) highlighted the simplicity of Mode-S in a forum dedicated exclusively to that activity. Dick Jansson (WD4FAB) AMSAT-NA's VP for Engineering, was also on the program and brought

Hamvention attendees up to speed on the latest developments with Phase 3-D. In addition, Ron Broadbent (G3AAJ) the Honorable Secretary of AMSAT-UK, gave his organization's perspective on the Phase 3-D project. Ron also announced to the group that a $100,000 contribution from AMSAT-UK was recently made to the Phase 3-D project specifically for the purchase of flight batteries for the new spacecraft.

Unfortunately, two days of steady rain on Friday and Saturday followed by extremely cold weather on Sunday kept most of the crowd indoors. Despite the bad weather, however, well over 200 people stopped by the booth to initially join or renew their memberships in AMSAT-NA.

New items at this year's AMSAT booth included two new software programs and a number of other items. Joe Holman (KA7LDN) unveiled AMSAT-NA's first ever Microsoft Windows-based satellite tracking program called WINSAT. In addition, a new Microsoft Windows-based PB/PG packet software package called WISP written by Chris Jackson (ZL2TPO), was premiered at the booth. Needless to say, both of these new AMSAT software packages were in great demand by Hamvention attendees.

Other new items included an AMSAT 25th Anniversary patch and decal. Also, several new books were premiered at the booth, including the fourth and latest edition of "How to Use the Amatuer Radio Satellites" by Keith Baker (KB1SF) and a newly revised "AMSAT-NA Digital Satellite Guide" edited by Gould Smith (WA4SXM).

[The AMSAT News Service (ANS) would like to thank KB1SF, W3XO, and KA3HDO for this bulletin item.]

G7MBF Recognized For His Research With POSAT-OSCAR-28's GPS Experiment

Congratulations are in order for University of Surrey (UoSAT) student Martin Unwin (G7MBF) who won the "Best Student Paper Prize" for his paper titled "Differential GPS Implementation on Microsatellites" presented at the recent Differential Satellite Navigation Systems Conference held in London. The award was sponsored by INMARSAT and the Royal Institute of Navigation and consists of $1,000 to be used for continuing research in GPS at UoSAT; it was presented to Martin by Olaf Lundburg, the Director General of INMARSAT.

The PoSAT-OSCAR-28 GPS experiment has been highly successful automatically generating keplerian elements on-board based on GPS location measurements. Efforts are under way to use ground-based radars or other "cross-checks" to see just how accurately the GPS receiver is measuring the satellite's

position in orbit.

[The AMSAT News Service (ANS) would like to thank Jeff Ward (K8KA/G0SUL) for this bulletin item.]

AO-13 OPS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 127.03 FROM AMSAT HQ
SILVER SPRING, MD MAY 7, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-127.03

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS
14-May-94 1700 B 167 WA5ZIB W5IU
21-May-94 2130 B 185 VE2LVC W9ODI

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

"Slow Scanners" are invited to join the SSTV sessions on AO-13. The frequency is 145.955 MHz. The net meets at 45 minutes before Mode S, and on Mode B following Mode S on Saturdays and Sundays. Join those sessions or convey your wishes for other SSTV skeds to wb6llo@amsat.org, and he will coordinate your efforts.

WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 127.04 FROM AMSAT HQ
SILVER SPRING, MD MAY 7, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-127.04

Weekly OSCAR Status Reports: 07-MAY-94

AO-13: Current Transponder Operating Schedule:
M QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Apr 07-Jul 11
Mode-B : MA 0 to MA 170 |
Mode-BS : MA 170 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only

Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Blon/Blat 230/-5
Mode-B : MA 250 to MA 256 |
Omnis : MA 250 to MA 120 | Move to attitude 180/0, Jul 11
[G3RUH/DB2OS/VK5AGR]

FO-20: The FO-20 ground command station has confirmed that the bird has been malfunctioning. The operational schedule announced previously is currently suspended and the analog mode will be continued indefinitely. Further operation schedule will be announced on and after 11-May-94. [Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

KO-25: KO-25 B has apparently been moved to the alternate receive frequency because of trouble with the other receiver. So uplink now is 145.870 MHz. The controllers note that the receiver may be turned off intermittently due to receiver testing. [WH6I]

AO-16: Working well. [WH6I]

LO-19: Operating normally. [WH6I]

KO-23: Operating Normally. [WH6I]

UO-11: WB1HBU talked with Doug Loughmiller (G0SYX) of the University of Surrey (UoSAT) while they both were at the Dayton Hamvention and G0SYX indicated that UO-11's S band beacon is now on continuously. The frequency is 2401.5 MHz. [WB1HBU & G0SYX]

RS-10/11: WA6ARA reports that RS-10 is operating beautifully! The passes at his QTH are coming around again in the late evening. WA6ARA is presently using QRP power, about 5W, using CW into a J pole with excellent results. WA6ARA says that "this bird continues to put out an excellent signal." [WA6ARA]

RS-12/13: HA5WH friend, Sanyi (XU7VK), is working from Cambodia during the daytime on RS-12. His biggest problem is finding stations to make QSOs with. HA5WH requests all stations in that area who use RS-12 to listen for XU7VK on RS-12. [HA5WH]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

687. FCC REGS?

Newsgroup: rec.radio.amateur.space
Date: 1994-05-09 04:07:00 UTC
From: ronald.hobbs@toadhall.com
Message-ID: <73.897.3344.0N690CF9@toadhall.com>
Source record: 27557

CROSSPOST ALERT

I have seen Ramsey Electronic's Ads for transmitters for "Dorm"
stations,etc.

I would like to put a station on the air that doesn't violate any FCC
Regs or entail great licensening expense (or power). Does anybody know
anything? I am a ham radio operator, don't want to jeopardize my ticket
or run a pirate station. I have the "book" here but who knows chapter
and verse?--the FCC lines are always busy.

Thanks for your space and time. 73 de Ronald.

688. Is there a Pacsat/Internet Gateway??

Newsgroup: rec.radio.amateur.space
Date: 1994-05-09 06:50:29 UTC
From: Jim Corenman <dentarthur@delphi.com>
Message-ID: <5k7s8RI.dentarthur@delphi.com>
Source record: 27541

This is probably a dumb question, but I've been unable to find the answer amongst the packet or satellite faq files, or anywhere esle I've looked. Frequencies and modes I found, but is it possible, on a routine basis, to pass messages between the packet birds and internet e-mail?

It sounds like it ought to work, in theory, but I have not seen any reference to a gateway between a pacsat and anything else, like either the 2-meter packet or internet directly.

The goal is to be able to pass traffic to and from our sailboat from offshore in the South Pacific. Going between internet and the terrestrial packet network is no problem, but then what?

If it can be done, which birds, and how should the traffic addressed? Any information or places to look would be greatly appreciated. We're returning to Auckland in a few days to rejoin our boat and head back to Tonga.

I notice that the March/April issue of the "AMSAT Journal"
has orbital elements for three satellites named MET-3/4, MET-3/5
and MET-2/21, NORAD Ids 21232, 21655 and 22782 respectively.
What are these satellites? Do they have any accessable
amateur gear on board? If so, what are the frequencies and
modulation?

Thanks,
Dave, N9LTD

Best case hoorizontal resolution is 4800 pixels per line. The grey scale
resolution depends on your convertor.

Meteor 3-4 and Meteor 3-5 are Weather-Satellites lauched by the former USSR. Meteor 2-21 is one of the older Meteor-2 - Class-Weather-Satellites, lauched end of 1993 by Russia. Met 3-5 and Met 2-21 transmit real-time-images using APT (Automatc Picture Transmission) on 137.85 MHz (3-5) and 137.40 MHz (2-21). They use FM-Modulation (15 kHz deviation) to transmit an AM-Subcarrier of 2400 Hz modulated by the image, 2 lines per second, max 1600 Hz image-data. No "classical" amateur-gear (transponder/repeater etc).

Hope that helps a little
Peter

> john.boyer@rd.eng.bbc.co.uk

Oh, I am in doubt....if you talk about APT.
Subcarrier is 2400 Hz, AM-modulated max 1600 Hz, 2 Lines/sec
containing a vis-Line and a Th.IR-line. So we can rely on just
not very much more than 400 dots per line. This gives a pixel-
resolution of 7.2 km x 3.6 km (scan-dir x orbit-direction).
Resolution of greyscale is not better than 1:200 (if you reach that,
normally your converter will achieve 1:64 or so): APT is an
analog format.
HRPT-Resolution is 2048 Pix/lin, 10 Bit depth per channel, a frame
has 5 channels, 6 frames per second. Resolution is just below 1x1 km.
10 Bit depth: HRPT is a digital format, you will see the full
resolution or nothing.

Regards
Peter

MONDAY MAY 9, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* SPACE CALENDAR *
==================
May 10 - Annular Solar Eclipse, Visible from Mexico, USA, Canada
May 20 - Resurs Launch (Russian)
May 24-25 - Partial Lunar Eclipse
May 25 - DSPSE (Clementine), 4th Earth Flyby
May 27 - DSPSE (Clementine), Lunar Flyby

[Info via LU7AKC]

* WEBERSAT NEWS *
=================
WEBERSAT (WO-18) is broadcasting new pictures and light spectrometer data weekly. Software for the extraction, decoding, and display of spectrometer data, written by Bob (KB7KCL), is available on LO-19 (file #s 371a/3739), or directly from Weber State University. Monday UTC continues to be the day for the broadcast of the most recent spectrum, along with the week's WOD.

WeberWare 1.0, 1.2, 1.3, or a similar program is required for picture extraction, decoding, and display. WeberWare 1.3 is the current software version, and is available from Weber State University, AMSAT-NA, or AMSAT-UK. The most recent WeberSat double field image is number 10/14, which was taken of an as yet unidentified area of Northern Nigeria, Africa. The photo has very few clouds, and land features are clearly visible. Expect new photos sometime during the week of May 9th.

WO-18 is currently sending spacecraft solar array current whole orbit data (WOD). This is an excellent opportunity for a student, group, or class to use this data for spacecraft motion studies, or for studying the long term effects of the space environment on solar cell effeciency. WOD collection and broadcast will adhere to the following schedule:

1 May/Week1: Array currents, Ch# 26 27 28 29 2A 2B
8 May/Week2: Array currents, Ch# 26 27 28 29 2A 2B during 10-May-94 eclipse
15 May/Week3: BCR, 21 22 29 2F 33 36
22 May/Week4: Temperatures and impact detector, Ch# 14 2F 30 35 3B 40
29 May/Week1: Array currents, Ch# 26 27 28 29 2A 2B

* MICROSAT DESIGN AT STANFORD *
==========

Over the years a number of Stanford researchers have been involved in the design and operation of dozens of different kinds of space vehicles. But, beginning this year, the Aeronautics and Astronautics Department has initiated a new program that involves students in designing, constructing and controlling small, simple and inexpensive "microsatellites" that are launched into orbit.

On Thursday, April 21, two dozen engineering students involved in this program at Stanford University showed a mock-up of their first satellite design to a visiting Russian official, Yuri Plotnikov, professor of flight mechanics and control design at the Moscow Aviation Institute.

If the project goes as planned, a year from now the 2-foot-wide hexagonal satellite will hitch a ride on top of a Delta rocket along with a commercial satellite. Once it goes into orbit, the satellite will begin beaming back digital pictures of Earth and broadcasting its position and status over ham radio channels with a synthesized voice.

"The program has two major objectives," said Robert Twiggs, a visiting professor brought to Stanford from Weber State University in Utah to jump-start the new small satellite development laboratory. "First is to give graduate students in aero-astro and other departments practical, hands-on experience in designing and building something that can be launched into space in only a year on a very limited budget. Second is to provide faculty, students, space experimenters and industry with an opportunity to do inexpensive space experiments."

Plotnikov's interest stems from the fact that the Moscow Aviation Institute is a professional school with 15,000 students devoted to aerospace design. "The name is historical. Actually, we design anything that flies," he said. The institute currently has a joint satellite program with Utah State University. When asked whether something similar is likely with Stanford, he shrugs and replies, "It's all a matter of funding."

The students have nicknamed their design the Stanford (or Satellite) Quick Research Testbed, or SQUIRT. They hope that this could become a de facto standard for microsatellites, which are a growing phenomenon worldwide. Students at the University of Umea in Kirna, Sweden, are working on a parallel design. So far, about a dozen student-designed microsatellites have been built and launched.

The watchwords for these satellites are simple and inexpensive. So the Stanford design uses powerful magnets to keep the satellite aligned perpendicular to the Earth's magnetic field, rather than employing

complicated gyros and thrusters to control its position.

"Usually, the reason for a satellite is its payload. But we are doing things backward. Our purpose is to get the experience of designing the satellite, so what it carries is of secondary importance. However, we've tried to come up with a payload that will be interesting and worthwhile," said Christopher Kitts, a graduate student in mechanical engineering.

The payload the students have agreed upon is a digital camera, voice synthesizer and global positioning satellite system receiver. The GPS receiver will allow student controllers to determine the satellite's position. Simple photocells will determine when the camera is pointing toward the Earth. That will allow the Logitech digital camera to snap images of different parts of the globe that will be transmitted by radio to interested ham radio operators.

According to Kitts, participants hope that the pictures and synthesized messages from the satellite can be used in elementary schools, middle schools and high schools to help interest students in science.

REVISION: 9 MAY 1994

CONTENTS:

Foreword - my ramblings
Bibliography - list of sources and how to get more information
Modes - common satellite operating modes
Satellites - descriptions and background history of common satellite
Antennas - discussion of what works best
Preamps - discussion of what is needed
Rigs - popular satellite rigs and features
Accessories and Other Stuff - things that make satellte operation easier
Frequencies - list of most hamsats with uplink/downlink freq/modes
Aliases - list of satellite common names with their other aliases

FOREWORD:

Having recently started to get into Satellites, I asked MANY people what it took to get started and what to do. I found few people who could offer all the information necessary to start. I have attempted to compile this information for future newbies. If I have missed something, please ask and I will attempt to add it to the collection. Any comments can be sent directly to me, stephen@mail.boi.hp.com. Copies of this article should be available in the following locations:

oak.oakland.edu:/pub/hamradio/docs/faq
ftp.cs.buffalo.edu:/pub/ham-radio
Clear Skies BBS (608)249-7130

Also, if you really want to get serious about satellites, I would STRONGLY recommend joining AMSAT to help promote the satellite hobby. AMSAT is a volunteer organization that works for the interests of amateur satellites. Dues are only US$30 per year and you will receive a subscription to "The AMSAT Journal". For US$80, you will receive first year dues and a copy of Instant Track computer tracking software which is a top-notch program. Instant Track was donated to AMSAT by its author and its sales account for a considerable portion of AMSAT's income. AMSAT-NA, 850 Sligo Avenue, Silver Spring, MD 20910-4703. (301) 589-6062. Credit cards welcome.
NOTE: I am in no way connected with AMSAT-NA, other than I have found their publications quite useful.

BIBLIOGRAPHY:

The following text was compiled from the following sources and from comments from many operators:

* "How to use the EZSATS pass tables by N9LTD" and "Hamsat aliases" reprinted with permission. Full text, tables, and lots of other useful information can be obtained by sending a SASE to David Mullenix N9LTD, 2052 Brentwood Pky, Madison, WI 53704 or call the Clear Skies BBS at (608)249-7130.

* "Amateur Radio Satellite Frequencies" This file can be obtained from the ARRL e-mail server. For information on the server, send an e-mail message to info-serv@arrl.org with 'HELP' in body of message.

* "Summary - Getting onto the Hamsats" This was an article posted to rec.radio.amateur.misc newsgroup by Stephan Greene (sgreene@access.digex.com) on 20 Mar 1992. The article is also available via anon ftp from ftp.cs.buffalo.edu or Australian mirror at grivel.une.edu.au as file pub/hamradio/ham_sat_sum.

* "An Amatuer Satellite Operation Upgrade Path" from the AMSAT Journal, September/October 1993, pp. 24-26.

MODES:

The combination of uplink freq, downlink freq, and transmission mode are all lumped together into standardized satellite MODES. Here is a list of common satellite modes used by satellites covered by this article:

A - This mode requires a 2 meter SSB/CW trasmitter and a 10 meter SSB/CW receiver and supports CW and voice.

B - This mode requires a 70 cm SSB/CW transmitter and a 2 meter SSB/CW receiver and supports CW and voice. Some satellites also support RTTY and SSTV in this mode.

K - This mode requires a 15 meter SSB/CW transmitter and a 10 meter SSB/CW receiver and supports CW and voice. This mode is unique in that it can be done with a simple HF rig.

JA- This mode stands for J Analog and requires a 2 meter SSB/CW transmitter and a 70 cm SSB/CW receiver and supports CW, voice.

JD- This mode stands for J Digital and requires a 2 meter FM transmitter and and a 70 cm SSB/CW receiver and supports packet.

S - This mode requires a 70 cm SSB/CW transmitter and a 2.4 GHz SSB/CW receiver and supports CW and voice. Many people use a 2.4 GHz to 2 meter converter with a 2 meter SSB/CW receiver instead of buying a 2.4 GHz SSB/CW receiver.

T - This mode requires a 15 meter SSB/CW transmitter and a 2 meter SSB/CW receiver and supports CW and voice.

Some satellites have dual modes that operate simultaneously. For example, AO-13 can operate in mode BS which means that it can do both mode B and mode S simulaneously. Other common dual modes are KT and KA.

Also, satellites have 3 basic types of retransmissions: beacon, transponder, and repeater.

Beacon - Most satellites have a fixed Morse beacon at the lower end of the satellites band-pass transponder. This is useful to detect when the satellite has crossed the horizon and is in range for operation. It can also be used to determine dopler shifts.

Transponder - A transponder is a band-pass repeater. It accepts a range of frequencies on the input and retransmits the entire range on the output. All offsets withing that range are preserved. NOTE: since the satellite is transmitting many signals at the same time, it is dividing its output power amongst all of these signals. If someone transmits a very powerful signal into the satellite, it will spend most of its power retransmitting that signal and all of the other signals will drop in power. This is NOT a way to earn friends and people who overpower the satellites input are called "alligators" and are not very popular.

Repeater - This closely resembles a land-based repeater. It listens for signals on one frequency and retransmits it on another frequency. All satellite repeaters (and transponders) are full duplex, meaning you can (and should) listen to you signal on the downlink (with headphones) while you are transmitting.

SATELLITES:

Some satellites are easier to work than others. The satellites that follow can be operated fairly easily and are referred to by some as the Easy Sats. What follows is a breif description of each satellite. A summary list of operating frequencies is included later.

Mir

Mir (promounced "mere" - "Peace" in Russian) is the Russian Space Station. It's been in orbit since 1986. All recent Russian Cosmonauts have been hams and have callsigns with "MIR" in them, such as U2MIR. Mir has 2-meter equipment on board and they operate packet and voice on 145.55 MHz. (This is the same freq as the Space Shuttles.) The cosmonauts also have a digital voice recorder which can repeatedly transmit voice announcements.

The best way to get a QSL card from Mir is to connect to their TNC's mailbox, R0MIR-1, (That's R Zero MIR) leave a message AND GET A MESSAGE NUMBER. You must have the message number to qualify for a QSL. The TNC is often busy because amatuers forget to disconnect before Mir goes under their horizon. In a case like this, try connecting to yourself or a friend VIA R0MIR. And if you hear a heavily accented voice calling CQ, by all means say hello!

70 cm and ATV gear is being prepared for future flights!

QSL Address:
Sergei Samburov (RV3DR)
Prospect Kosmonavtov. d.36, kw.96
Kaliningrad City, MOSCOW 141070, RUSSIA.

Sergei can also be reached via packet radio as RV3DR @ RK3KP.#MSK.RUS.EU

A special note on caculating Mir's orbit: Mir is big and it's in a low orbit. This means that there's a lot of atmospheric drag and it has to fire

its rockets every month or two to boost itself back up or it would have re-entered and burned up long ago. Unfortunately, whenever this happens, it throws off all pass predictions. When this happens, Mir will arrive LATER than predicted, so if you tune to 145.55 and nothing happens at the predicted time, keep waiting, it may be along in 10-30 minutes.

SEEING MIR: Mir is also the only EZSAT that can bee seen. Mir is very big, about the size of a semi-trailer, and when it comes over just after sunset or just before sunrise, you can often see it go by. This is because Mir will still be in sunlight whil you're in the earth's shadow. In these cases, Mir looks like a very bright star gliding acress the sky. It's a beautiful sight and well worth looking for. It's best to use a tracking program set to VISUAL to find visible passes. The best such programs will even draw you a star map and show you Mir's path across it. Don't forget to tune to 145.55 when you see it. Also, don't forget to get on the local repeater and tell people when you spot it so that others can share in the fun.

RS-10/11, RS-12/13, OSCAR-21(RS-14)

These three satellites are all in 600 mile high polar orbits, which carry them over the US six to eight times a day for 10-18 minutes at a time. They all have orbital periods of about 95 minutes and we typically get two sets of three or four passes spaced 95 minutes apart. The two sets of passes are spaced 12 hours apart and their passes come a little earlier each day because their orbits don't take quite exacly 95 minutes.

These satellites all have a coverage circle about 4000 miles in diameter, so when they're about the horizon, you can use them to work hams anywhere in the conteinental US, Canada, Alaska, Mexico, Central America, South America down to the Equator, the Caribbean, Greenland, Iceland and parts of Scandinavia. Eastern hams can work Europe and the West can work Hawaii.

All of these satellites are in boxes that are bolted to larger Russian satellites and draw their power from the large satellite's solar cells. They are VERY easy to hear and fairly simple to work.

OSCAR-21

My favorite satellite. This is a German/Russian radio that uses a Digital Signal Processor (DSP) chip and it is Flexible with a capital "F"! It was launched in January, 1990 configured as a linear translator which received a band of 70 cm CW and SSB signals and relayed them on 2 meters. The bird was, to put it mildly, under-utilized. Then in 1992 the DSP chip was reprogrammed in orbit into a cross band FM repeater! If you've been wondering if DSP is as powerful as you've heard, now you know! In the past year, it's telemetry has been re-programmed from an obscure format to standard 1200 baud packet. WEFAX pictures (which are uploaded by teh ground controllers) were added in December 1993. (This is the same format used by many weather sats and short wave weather stations.)

OSCAR-21 has an input frequency of 435.016 MHz, but 435.015 works just fine. It's output frequency is 145.987 MHz, but 145.985 or 145.990 will recieve it quite well. It has a strong transmitter and a ground plane antenna and most

HTs have no trouble picking its signals up when it passes over. Mobiles and base stations with omni antennas will receive it full quieting. You can get into this bird with 20 watts and a six element beam antenna. I mount my beam on a photo tripod next to my car and run coax to my dual band mobile. You have to point the beam accurately, so I take a list of altitude and azimuth bearing generated by simple tracking software out with me and re-point the beam once a minute. In one summer, I worked the east and west coasts, several Canadians, Texas and Guantanamo Bay, Cuba before fall's cold weather drove me indoors.

Some OSCAR-21 tips: you can hardly get a word in edgewise during "prime time" opening passes. Try the late night passes instead, they're much less crowded. OSCAR-21's transmit and recieve polarity rotate constantly during a pass. Mount your beam so you can easily rotate it for the best signal. Remember, all these ham sats are full duplex, so you can and should monitor your signal on the downlink. (Use headphones.) Turn the beam for minimum noise. You'll probably have to modify your dual band rig to get it to transmit on 435.015. BE CAREFUL beacuse FM is generally NOT appreciated below 440 MHz. Also, the mod may allow you to transmit out of band, which is a real no-no.

OSCAR-21 is also known as RS-14, AO-21 and Rudak-2. It's bolted to a satellite called INFORMATOR-1, which is often abbreviated INFORMTR-1. It's NORAD ID number is 21087. Be careful, the rocket booster that launched the satellite is still up there and it's named INFORMTR-1 R/B in some element sets. Your tracking program may find it instead of the satellite if you're not careful.

RS-10/11

This is probably the easiest satellite to work of them all. It has an incredibly sensitive receiver that can pick up the faintest two meter signal and relay it on ten meters. There are documented examples of people having QSOs on RS-10/11 by clicking Morse on HTs with rubber duck antennas! I guarantee you that your HT can put a useable signal into RS-10/11, I've done it myself. WARNING: if you try this, disable the microphone so you don't transmit any FM sidebands and turn your CTCSS (PL) OFF!

RS-10/11 (Radio Sputnik) is for CW and SSB signals, so an all mode 2 meter rig is ideal for transmitting to this bird. The input bandpass is from 145.860 - 145.900 and the output freqs are from 29.360 - 29.400 MHz. There is also a morse beacon at 29.357 MHz.

RS-10 is also equiped with a feature called ROBOT. The ROBOT is an automatic on-board QSO computer. To work it, send the following at about 15-20 wpm on 145.82 MHz (an automated keyer works best):

RS-10 DE (your call) AR

If the ROBOT hears you, it will respond on the 29.403 MHz downlink with:

(your call) DE RS-10 QSL NR (number) OP ROBOT TU USW QSO (number) 73 SK

If you want a QSL card, try sending the QSL number the ROBOT sent back to you on your QSL (along with an SASE and return postage) to:

Andrey Mironov
UL Vvoloshinoj. D11. KV72.
141000 Station Perlovskaya
Moscow, Russia

RS-12/13

A cousin to RS-10/11, RS-12/13 is also a 40 KHz wide linear transponder. However, this bird is unique because its input frequencies are in the fifteen meter band! This is also the only ham sat in the sky that requires more than a code free technician license to work it, because its input band is from 21.210 - 21.250 MHz. This straddles the Advanced and Extra portions of the 15 meter band. Its output freqs are from 29.410 - 29.450 MHz. Because of skip, this satellite can often be heard and worked when it's below the horizon! At least one person has earned DXCC on this satellite! RS-12/13 is bolted to yet another Russian satellite and its NORAD ID is 21089. RS-12/13 also has a ROBOT mode like its brother RS-10/11.

DOVE

DOVE is short for Digital Orbiting Voice Encoder and is a transmit-only hamsat (it has no user accessible receiver). Built in Argentina, DOVE was launched in 1990 as a good will satellite to introduce children and newcomers to amateur satellites. It was originally intened to transmit digitized voice messages that could be picked up by students with simple receivers. Unfortunately, the digital voice hardware and software has been a constant source of problems since launch. Atempts to get DOVE to works properly are proceeding as this is written, so the best bet is to tune your 2-meter rig or scanner to 145.825 MHz and see what the bird is up to currently. Be ready for Morse, standard 1200 baud packet or (with luck) digitized voice messages. The signals are strong enough so that an HT with a rubber duck will hear it when it's overhead, although ground plane antennas will give better coverage when the bird is near the horizon.

AO-10

Known as Phase 3-B before it's launch by the European Space Agency in June, 1983, this satellite was designed for launch into a high elliptical orbit. This orbit, called "Molniya" orbit, places the satellite over one spot on the Earth for up to several hours at a time. This orbital configuration also allows for consistent, long haul DX communication because the satellite is visable to roughly half the Earth! This orbit virtually eliminates the frantic "hurry up" style of operation. But such a luxury is not without cost. At the farthest point in the Molniya orbit, this satellite is over 25,000 miles away from the Earth, meaning high gain antennas and higher power levels are required to get a workable signal up and through the bird. Also, even though radio waves travel at the speed of light, the over 50,000 mile round trip creates a signal path delay of about 1/4 second on the downlinked signal. It takes some time for satellite operators to get used to simultaneously speaking and listening to their own voices returning in

their headphones a quarter second later.

The first Phase 3-A launch ended in disaster when the Ariane booster malfunctioned, dropping the bird in the Atlantic. Phase 3-B, later to become OSCAR 10, met with somewhat better fortune, surviving the launch and first burn of its "kick motor" just fine. However, we later learned that the booster had apparently bumped OSCAR 10 shortly after separation which damaged one or more of its antennas and also caused other internal injuries because the second and subsequent kick motor firings never happended. This left OSCAR 10 in a lower inclination elliptical orbit. This meant that the bird didn't have the intended operational coverage nor enough solar panel illumination to sustain full operations. So today, OSCAR 10 is "sort of" operational. It is stuck in mode "B" with only its omnidirectional antennas working and it is slowly tumbling. Users are requested to listen for AO-10's 145.810 MHz beacon for a steady, unmodulated carrier before operating the bird. If the beacon is raspy or if your downlink signal appears to be shifting in frequency, users are asked NOT to use the transponder until it has a chance to slowly recharge its batteries.

AO-13

Launched in June, 1988, OSCAR-13 is now carrying the bulk of the long haul DX available via amateur satellite. It is the current--and much improved--brother to OSCAR 10. However, unlike OSCAR 10, it did managed to achiieve its "Molniya" orbit. OSCAR 13 also has the ability to automatically select transponders for each mode at different points in its orbit. This helps optimize the mode in use with its corresponding downlink antenna gain. OSCAR 13 did have some problems, however. It had a RUDAK experiment onboard that failed shortly after launch. Also, in June 1993, the 70 cm downlink transmitter ceased to function, putting an end to Mode J and L operation. However, modes B and S are still being supported and mode S is becoming increasingly popular. Also, AO-13's batteries are beginning to show signs of age and its orbit it deteriorating. The progressive effects of previously unknown gravitational interactions between AO-13, the Sun, the Moon and the Earth will all conspire to cause the satellite's re-entry into the atmosphere sometime in 1996.

ANTENNAS:

For AO-13, the consensus is get to get KLMs, Telex/Hy-Gains, or roll-your own, Nobody liked the Cushcraft satellite antennas - they appear to have problems in wet weather. Bigger is also better, if you have the space. Several people mentioned the KLM 22C and 40CX pair as excellent performers (again - you need the room for those long booms!) KE4ZV stated his pair of KLMs (the big ones!) lets him work AO-13 with 3 to 30 watts (hardline feed and rigorous attention to routing the feedlines and cables properly to maintain the antenna patterns helps, too.). Others mentioned the KLM 14C/18C pair as good performers - but you need more power on the uplink.

Telex/Hy-Gain antennas were recommended by several people as a less expensive alternative to KLMs that work almost as well. There's also M2 (started by an engineer from KLM). While no one who responded uses them,

the information I received from a call to their factory in California suggests they are comparable to slightly better than the KLMs in performance, and about the same in cost. Dave, WB6LFC, said homebrewing antennas is also feasible - it takes work, but attention to detail results in top-notch performance for very little money. Finally, Ross, VE6PDQ, reported good results using a pair of Cushcraft 215WBs on receive.

Problems encountered with AO-13 antennas include routing cables and feedlines off the back of the antennas (to preserve antenna patterns), use of fiberglass cross booms, mounting preamps as close to the feedpoint as possible, and long antenna booms drooping. (Gary, KE4ZV, recommends using a rope to brace the boom or stiffening booms and fiberglass masts internally with foam-in-a-can insulation.)

On antenna rotators, it appears the Alliance UD-100 is no longer made, though it should still show up at hamfests. People with long-boom antennas report the Alliance rotator is too weak to move a big array anyway, and recommended Yaesu's elevation-only rotator or their Model 5400 azimuth-elevation unit.

Antennas for the low-altitude satellites appear to be much less critical. J-poles were most frequently mentioned (the design from the AMSAT Journal?), but dipoles, ground-planes, and yagis are also in use. Several people work RS-10 quite well with antennas in the attic. Best results are with steerable antennas, but the high operator workload during a pass (unless the satellite is just grazing your access circle) almost demands computer control of the rotators.

PREAMPS:

You need a preamp for AO-13. (I can hear the downlink after a fashion on a Ringo fed with cheap coax and a 10 dB preamp in the shack, but it's not communications quality reception!) Only two people mentioned a specific brand name (Advanced Receiver Research and the unit included with the Ten-Tec 2510), so I assume almost any GAsFET preamp in the 20dB gain class is adequate. THE PREAMP MUST (almost always) BE MOUNTED AT THE ANTENNA (check the discussion in Chapter 9 of the Satellite Experimenter's Handbook and you'll see why!). KE4ZV recommends mounting the preamp AT the antenna feedpoint, if your elevation rotator can handle the unbalanced load.

While no one mentioned it (maybe it's obvious), if the antenna is used to transmit (say Mode J) as well as receive (on Mode B, for example), the preamp MUST either include RF-sensed switching, or be switched out of the line before you transmit. TRANSMITTING INTO AN UNPROTECTED PREAMP WILL DESTROY IT INSTANTLY!

Preamps also seem to help on RS-10 (especially with older HF rigs) and on the Pacsats. It seems to be a case of "try it, and get a preamp if it looks like it would help").

RIGS:

Three radios were mentioned by name - Yaesu FT736 (and it's predecessor, the 726 with satellite module), Kenwood TR751 (a mobile-capable 2 meter multimode), and Ten-Tec's 2510. The Ten-Tec unit is out of production. The few units left are selling for about $300-350. I'm sure other multi-mode radios, and setups with converters and transverters work well, too - it's just that no one mentioned any by name.

Power output required is a function of the satellite, your antennas, and how badly you want to communicate. [QRP on the satellites is just like QRP on HF - you need good antennas and feedline, you have to pick optimal passes, and skilled operators at both ends are needed. Given the apparent "calmer" operating style on AO-13, QRP is probably easier there than on 20 meters!]

Anyway -about power for AO-13. 3-30 watts will work if you have top-notch antennas (KE4ZV). KC7IT uses 50-100 watts (Ten Tec 2510, Mirage D1010 amplifier, KLM 14C/18C fed with 50 feet of 9913). Both KE4ZV and KC7IT use Mirage D1010 amplifiers on 70 cm when they need a little extra power. For an "optimum station", WA5ZIB recommends 60 watts on 70 cm and 80 watts on 2 meters for AO-13, assuming good antennas (Telex/Hy-Gain or better) and feedlines, and 20 watts to a 5' dish for Mode L. Andy emphasized that you can get by and have lots of fun with much less!

For Mode A, WA5ZIB said 6 watts to the AO-13 2 meter antenna will work well. People using omnis report success with the Pacsats running 50-70 watts to a J-Pole (N5VGC). Several people said they (or someone they know) have no trouble using RS-10 at lower power (10-25 watts) with simple, omnidirectional antennas. Again, it's a case of "try it and see if it works."

There was unanimous consensus that the receiving quipment (antenna, preamp, feedline, and receiver) is more important than the transmit equipment. Running more power "to hear yourself" is frowned upon, to say the least! It's also important to be able to vary uplink power to adjust to specific conditions. Both the Ten Tec 2510 and the Yaesu 736 have continuously variable power output (I guess the rest of us just have to fiddle with the drive controls on our rigs!).

ACCESSORIES AND OTHER STUFF:

You need a PSK modem to use the Pacsats. PacCom makes fully assembled units, either already integrated with their own TNC, or as a board you install in your TNC-2 clone. They make similar 9600 bps units for accessing UO-22. The downlink receiver (on 70 cm) should be capable of being tuned by the PSK modem's AFC lines. Newer radios can use the up/down lines from the microphone jack or an accessory connection on the rear panel. Older radios must be modified, or be tuned manually. N5VGC told me he sees about 20KHz of doppler on an AO-16 pass, and that without automatic tuning, operator workload is too high to do much else besides tune the receiver!

Just about any radio suitable for packet on 2 meters will work for AO-16, WO18, and LU-19. To run 9600 bps on UO-22, modifications to bypass the microphone and speaker's audio processing circuits are required. I've seen some reports on rec.radio.packet and in the various Hamsat columns that

differences between UO14 and UO-22's transmitters make UO-22 more difficult to copy. (I'll worry about that problem later - I'll start with AO-16 and LU-19 first!)

No one mentioned computers - again, it must be obvious (also, we're "talking" using computers!). They're handy, and you need one IN THE SHACK when working the Pacsats or for automated, real-time control of antenna rotators (useful for low altitude satellites).

Other operator aids mentioned, or I thought of on my own: If your radio can't slave uplink and downlink tuning (Ten Tec 2510 and Yaesu 736 can), you need something to help convert between uplink and downlink frequencies (and account for doppler shift and calibration errors on the radios' frequency readouts). A cardboard slide scale or dial will work. I'm thinking of programming my HP48 to do the conversion for me. You need something like this to know where to tune on the uplink to hear a given downlink frequency.

Software to track satellites and predict passes. There are many programs that work. Price ranges from free to $70 for state-of-the-art QuickTrack or InstantTrack (available from AMSAT). Special software is also needed to use the Pacsats, and to interpret telemetry data. This software is also available from the usual ham sources, and from AMSAT (BTW, software sales support the amateur satellite program!)

Polarity switchers optimize antenna performance by allowing switching antenna feeds from RHCP to LHCP as the need arises. They are a very useful add-on, but don't appear essential.

Equipment to measure power output, SWR, transmit frequency - all useful (see - satellites are not that different from HF!).

Re: Bulletin For Immediate Release on all Military & Radio Boards.
Date: May 8, 1994
From: Edward Addy/KE0EG/AAM6RD/NACEC.HQ

* *
The North American Center for Emergency Communications, Inc.(NACEC)
Affiliate
Radio
System
(NARS)

NACEC is being developed to serve the emergency communications needs of
Military Families, Disaster Victims and Disaster Relief Operations. Thi
being done by building one of the most powerful commercial grade radio
communication centers in North America and making it services available
new tool to support the communications needs in these areas. NACEC
accomplishes this mission by maintaining its communications center's abi
to operate on and support radio communications on the Commercial, Milita
Federal Gov., State Gov. and Amateur Radio parts of the RF spectrum.
NARS is the Amateur Radio traffic support network for NACEC.

NARS is being developed as a high speed emergency traffic network consis
of trained and dedicated radio operators. Training & Testing are provid
during weekly radio nets that are conducted on amateur radio frequencies
NARS is intended for only those amateur radio operators that are serious
about helping others.

All MARS (Military Affiliate Radio System) members of any branch of
MARS are encouraged to participate. NARS is being fashioned after the
Army MARS network. It is hoped that NARS will help provide a better
understanding (and remove misconceptions) of the value of MARS,
while at the same time creating a system of combined Amateur and MARS
operators to handle emergency traffic. It is also hoped that NARS will
also create the opportunity for many new amateurs to join and increase
the membership of the various MARS programs. NARS membership currently
consists of about 25% MARS and 75% Non-MARS operators.

NARS Information & Training Nets are directed nets. All members of
the Amateur Radio Community are welcome to participate.

NARS nets meet on the following weekdays and times:

Week Day Net ID Time Freq. Mode

Sundays: NARS/A 24:00 UTC/7:00 PM LST 3.860 LSB
NARS/B 23:00 UTC/6:00 PM LST 7.262 LSB
NARS/C 22:00 UTC/5:00 PM LST 14.347 USB

** All HF nets meet +/- QRM and band usage.

Thursdays: In the Minneapolis & St.Paul Minnesota Area Only.
This net is currently held on the TCFMC repeater.

NARS/D 02:00 UTC/9:00 PM LST 146.76 FM
* LST is Minnesota Local Standard Time.

* *

Information on the NARS program can be requested from the NCS on any NAR

An Information Package with Membership App. will be provided by mail.

Specific questions regarding NARS or NACEC should be directed to:

701. AO-27 help?

Newsgroup: rec.radio.amateur.space
Date: 1994-05-09 23:53:37 UTC
From: greg@core.rose.hp.com
Message-ID: <CpK7pE.Hz3@icon.rose.hp.com>
Source record: 27551

Hi, folks,

Can someone walk through a typical pass of AO-27 for me? I am having a lot of trouble with this one, more than I would have expected from the comments I've heard.

Information that would be helpful:

downlink frequency at the start, middle, end of pass
uplink freq, how to find yourself
approximate signal strength expectations ("weaker than AO-21, but you don't need a pre-amp", or some such statement)
uplink power
antenna requirements

I have about 30 watts into a 5 element beam for the uplink, and an 8 element Quagi for the downlink. Cable runs are ~50 feet of RG-8 (I know this isn't ideal, but I should hear *something*).

Thanks,

Greg KD6KGW

p.s. The same info for FO-20 would be OK too, but I expect AO-27 is easier. I haven't been able to hit AO-21 yet either, but at least I can hear it clearly.

Check out QST. A few (less than 12) months ago they had an article about the "Easy Sats" (RS-10) which talked about the requirements for getting on the air through the birds.

My first setup was fairly modest, but was still good enough to make a number of contacts. Assuming you want to start with Phone on RS-10, you'll need:

An uplink transmitter - 2 meters SSB, 10+ watts, J-pole or ground plane ant.
A downlink receiver - I used my Radio Shack DX-440 shortwave radio. Turn on the BFO to receive the SSB signal. Dipole or long wire antenna.
A computer with a satellite tracking program & a current set of elements.

This will get you into RS-10. Other satellites are harder (i.e. more power, bigger antennas).

Good luck!

Greg KD6KGW

It is possible, and it is even implemented by both VITA and SatelLife on the
non-amateur birds, but I think that the regulatory problems have kept anyone from
doing it on the amateur packet satellites.

704. New AMSAT-NA stuff

Newsgroup: rec.radio.amateur.space
Date: 1994-05-10 14:59:20 UTC
From: "Walter K. Daniel KE3HP" <wk02593@worldlink.com>
Message-ID: <2977667927.1.wk02593@worldlink.com>
Source record: 27558

Some new AMSAT-NA stuff was mentioned in the ANS bulletin this past weekend. I spoke with Martha this morning to find price and availability. Everything is in stock, so hurry to your mailbox!

WINSAT, the Windows-based satellite tracking program, is $30 for members

WISP, the Windows-based PB/PG packet software, is $30 for registration. Martha says that the program itself is available from some of the satellites, but you send $30 to AMSAT for registration. If you can't download the program, request a disk when you order a registration number. The program is still being refined, but the registration number will work with new versions.

The AMSAT 25th anniversary patch is $5, the decal is $2

The AMSAT-NA Digital Satellites Guide is $12. This is an update of the Pacsat Beginners Guide and may be revised further in the future.

The new laminated frequency chart is $5

How to Use the Amateur Radio Satellites is $5

The most recent version of Weberware (1.3?) is $30 for members.

Note that these prices include postage for North American addresses. If you live in another part of the world, check with your local AMSAT group for availability of these items.

73, Walt KE3HP

Thanks Peter,that was really helpful.
Could you shine some light on the subject of aspect ratio??

Right now I have some 600 pixels on the x_axis(hor) and some 480 on
the y_axis,similar to VGA.This gives me rather distorted images from
NOAA 9 in that North to South is about 50 % stretched relative to

East to West.Is this simply perspective??

708. 435 MHZ down converters?

Newsgroup: rec.radio.amateur.space
Date: 1994-05-11 21:54:02 UTC
From: wa4ymz@aol.com

I'm just about set up for the packet sats with just one exception: I don't have a receive setup. I'm planning to use a TS-670, or possibly a TS-690, HF rig as an IF, but I'll be needing a down converter. Since the satellites seem to down-link on 435.xxx through 437.xxx MHz, I'll need one that will allow switching segments or have a 6M output. I have a mast-mount pre-amp at 70cM, but would like to mount the converter at the antenna to minimize coax signal loss. Is this a big concern if I use the pre-amp? I'd certainly appreciate suggestions and/or observations of the set-up anyone might be using. PS, can't really afford a full blown xcvr for the band at this time unless someone has something for sale or can point me in the right direction. Thanks.

Gary WA4YMZ

709. Re: Is there a Pacsat/Internet Gateway??

: This is probably a dumb question, but I've been unable to find the answer
: amongst the packet or satellite faq files, or anywhere esle I've looked.
: Frequencies and modes I found, but is it possible, on a routine basis,
: to pass messages between the packet birds and internet e-mail?
I'm quite active on the packet birds and I know of no such system. One
of the principle problems with establishing such a system is that the
legally allowed content of messages differs substantially between radio
and the internet and someone would have to monitor each message that was
passed into the radio system. Another problem is the relatively limited
bandwidth on the pacsats, they could easily be swamped with traffic from
internet.

:
: It sounds like it ought to work, in theory, but I have not seen any
: reference to a gateway between a pacsat and anything else, like either
: the 2-meter packet or internet directly.
2 meter packet is a different story. There exist a few digital nodes
that seamlessly bass traffic between the 2 meter system and the
satellites. I wrote the software that does this and operate one of these
nodes.

: The goal is to be able to pass traffic to and from our sailboat from
: offshore in the South Pacific. Going between internet and the terrestrial
: packet network is no problem, but then what?

I believe that one or more of the nodes I mentioned above is in this part
of the world, but whether you would be able to access it from your boat
is another matter. Please bear in mind that these nodes are designed to
let bbs users operate as if they were satellite groundstations, it is not
designed for bbs to bbs traffic. There is an international packet
forwarding system that works via satellite as well, but this works
virtually transparently. Your best bet, assuming you are contemplating
workign the satellites from your ship, might well be to either contact
the satellite forwarding coordinator (I'm not sure who is doing this
these days) and see if you can get special permission to tap into it (I
know this has been done for an occasional maritime mobil before) or to
find someone on the satellites who is willing to pick up your messages
and introduce them into the terrestrial system.

good luck and 73, John

I use a hamtronics which comes out at 28MHz, I have the 432 version but its
available in a 435 version. I'm quite happy with it, but according to the
poop I read here, it isn't the greatest thing around. For $100 it's at least
OK, at the circuit board is nicely done for what that's worth.

>I have a mast-mount pre-amp at 70cM,

Not at all. If you have a 20db gain preamp, then you can afford to have maybe
15db of loss in the coax before you get into trouble. You can use RG-58 on the
way down :-). I have the converter next to the HF receiver.

Note that sending power up the same line as the receive comes down
leaves you open to the one time when the relays don't change over just right
and you blow the preamp. Then you have to go get it off the tower etc. A real
pain. I've spent the extra money for some cheap coax for the receive line and
have one relay in the system at the antenna. If the relay doesn't change in
time for some reason,(and this will happen eventually), then your transmitter
faces an open circuit and the ALC shuts it down and the preamp is safe.

The best case, using a 0 dB NF preamp and a 0 dB NF converter,
results in a system NF of 1.16 dB due to the coax loss.

The usual rule of thumb is 10 dB more gain than noise figure
(noise figure of converter + coax loss). However, if you
are using a 435 yagi and a 0.4 dB NF preamp, you might need
a ratio closer to 20 dB to take advantage of the low noise
figure of the preamp. On 2 meters, the band is often too noisy
to really take advantage of < 1 dB receiver noise figures.

Back when the rule was formulated, I think anyone who had
a 0.4 dB NF preamp with plenty of gain could have told
you off the top of his head how to calculate system
noise figures.

There is also the receiver overload problem to consider--too
much preamp gain can overload the receiver in areas with
interference. Thus, it may not be practical to have a very
sensitive receiver on some bands.

717. 80ns EPROM - 27C512 and Trakbox

Newsgroup: rec.radio.amateur.space
Date: 1994-05-13 16:03:33 UTC
From: seeler@UPEI.CA
Message-ID: <seeler.120.768845013@UPEI.CA>
Source record: 27465

Has anyone been successful in finding 80 ns access 27C512 EPROMS for the trakbox upgrade? Canadian companies do not currently carry this item in stock - nor are they willing to part with just 1 - 3 units :-)

The name and phone number (non 800 #s pls) or location of American suppliers would be greatly appreciated!

Thanks in advance DAve Seeler, VY2DCS
Internet: Seeler@upei.ca

ps - a manufacturer is Advanced Microdevices (AM27C512-75 DC) for example.

718. Re: Is there a Pacsat/Internet Gateway??

Newsgroup: rec.radio.amateur.space
Date: 1994-05-13 20:48:19 UTC
From: lent@godzilla.mcs.anl.gov
Message-ID: <7688620995464@godzilla.mcs.anl.gov>
Source record: 27470

I know that there are several packet nodes that pass messages between
the packet network and the internet. So if one can pass messages between
the satilite network and the packet network, what do we need to do to make
the next hop into the internet?

how about:
internet through packet gateway to satilite gateway and vice versa?

I am not very versed in all the technicalities of this, but why wouldn't
this work? Is it just that it hasn't been done?
Can anyone provide an FAQ about how to pass messages between
packet <-> satilite?
I have seen lists of internet <-> packet gateways on the radio ftp sites.

MM> like to get more information. If you
MM> have any files or information that
MM> you could forward I would be greatful.
MM> 73 Mike N9WJV

Hi Mike, Just for starters ... what type of equipment do you have on hand
right now?

Bye for now. Paul J.

720. sat contacts with Antarctica

Newsgroup: rec.radio.amateur.space
Date: 1994-05-14 06:10:10 UTC
From: brent@network.ucsd.edu
Message-ID: <2r1q02$adv@network.ucsd.edu>
Source record: 27474

Hello,

I have been playing around on RS-10 and Eyesat-1 over the past couple of weeks with no problem getting into either bird. Unfortunately, it's getting pretty boring talking to myself...

Does anyone live in or know anyone in New Zealand or southern South America who would be interested in attempting a satellite contact with KC4AAA? This has never been done before at this station, at least on the ham satellites. I'm in the process of putting together a station for some of the other satellites to try to make contact with the states, but right now can only come up on RS-10 and Eyesat-1. Co-visibility to NZ on RS-10 is brief, but contact would be possible.

Brent Jones
KB1UK/KC4AAA

721. Two-Line Orbital Element Sets (TLE394)

Newsgroup: rec.radio.amateur.space
Date: 1994-05-14 14:06:24 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.768924384@afit.af.mil>
Source record: 27475

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

722. Re: 435 MHZ down converters?

Newsgroup: rec.radio.amateur.space
Date: 1994-05-14 23:37:06 UTC
From: wk@frc.maf.govt.nz
Message-ID: <1994May14.233706.6282@frc.maf.govt.nz>
Source record: 27476

The 70 cm -> 10 m down converter is the approach I have taken to get on the microstats. It helps if your HF rig has a general coverage receiver, as you'll need 3 MHz of IF to cover the 70 cm sat band. I have converted 435 MHz to 27 MHz (finally a use for that band :-) and 438 ends up at 30 MHz.

The 408 MHz crystal train is out of a German book (UHF Unterlage), driving an SBL1 diode ring mixer. The ARRL handbook has some good hints on how to terminate the SBL1 properly. Another book worth looking at for down converter design is the VHF/UHF DX handbook, published by the RSGB if I am not wrong, this book has excellent design tips on transverters and RF power amps.

You could move your preamp to the mast head, or even the entire converter. The choice depends on your transmission (rx?) line losses. If losses are high, you should consider putting the entire converter up, to allow you to minimize front end gain and improve intermod performance.

Moderate losses, and you could put up with the less than ideal gain distribution and use a masthead preamp only. In case of a short run of good quality coax, you could decide to trade a little bit of performance for the convenience of having preamp and converter in the shack.

If you are using a beam to track the micro sats, things become much less critical, an omni downlink antenna places much higher demands on noise figure, sensitivity and intermod resistance. Basically, there are no hard and fast rules: 'it depends'.

Using a GP and 15 m of RG58 (all electronics in the shack) I receive the microsats around S5 during good passes. I get them from 20 deg elevation, but as expected fading gets pretty bad when the rise high. Signals aren't really good enough, the TAPR PSK modem has trouble AFC tracking at times. I am working on a Lindenblad which will have a 3SK97 masthead preamp and RG213 coax.

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

10th Annual AMSAT-NA Symposium Information

The 10th AMSAT-NA Space Symposium and Annual Board-of-Directors Meeting will be held this year in Orlando, FL on October 7,8, and 9th. The location of the Symposium will be the Holiday Inn near the Orlando International Airport. For further information about the Symposium, please contact Martha Saragovitz at AMSAT-NA Headquarters at (301) 589-6062. Start your planning now so that you can be ready to attend this year's AMSAT-NA Space Symposium.

XE1TU Announces That Launch Date For UNAMSAT-1 Is Set

David Liberman (XE1TU) has spent the past five weeks in bed trying to get rid of a bad case of hepatitis. But he reports that he is well again and back in the lab preparing to begin the launch campaign of UNAMSAT-1 MICROSAT. The launch date has been set for the 15-JUNE-94, but there is a possiblity that it might get delayed about one week. XE1TU and his UNAMSAT-1 team is preparing to leave Mexico City soon to fly to Moscow where UNAMSAT-1 will be put into a thermal vacuum chamber and tested before it is attached to the launch vehicle.

XE1TU would like to thank all those who sent him "get-well" messages and cards and he promises to answer all of them. XE1TU notes that when he returned to work last week, he had over 530 messages waiting for him on e-mail!

Watch for progress reports about the launch campaign of UNAMASAT-1 in the AMSAT News Service (ANS) bulletins.

[The AMSAT News Service (ANS) would like to thank David Liberman (XE1TU) for this bulletin item.]

Current AMSAT Operations Net Schedule For AO-13

AMSAT Operations Nets are planned for the following times. Mode-B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz. If, at the start of the OPS Net, the frequency of 145.950 MHz is being used for a QSO, OPS Net enthusiasts are asked to move to the alternate frequency of 145.955 MHz.

Date UTC Mode Phs NCS Alt NCS
21-May-94 2130 B 185 VE2LVC W9ODI

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations, are encouraged to join the OPS Nets. If neither of the Net Control Stations show up, any participant is invited to act as the NCS.

"Slow Scanners" are invited to join the SSTV sessions on AO-13. The frequency is 145.955 MHz. The net meets at 45 minutes before Mode S, and on Mode B following Mode S on Saturdays and Sundays. Join those sessions or convey your wishes for other SSTV skeds to wb6llo@amsat.org, and he will coordinate your efforts.

726. Connecting an FT-726R to a G3RUH modem?

Newsgroup: rec.radio.amateur.space
Date: 1994-05-16 14:54:47 UTC
From: little@iamu.chi.dec.com
Message-ID: <1994May16.145447.22982@nntpd2.cxo.dec.com>
Source record: 27481

Given how popular the FT-726R was for satellite operation, certainly someone out there must have worked out the easiest way to connect one to a 9600 FSK modem. I've found the output of the demodulator for receive that is easy to access, but haven't found a similarly easy spot for injecting the xmit side into the modulator. If anyone knows of the easiest (least impact on the FT-726R) way to connect up a high speed modem, I'd sure like to hear about it.

73 es tnx,
Todd

: and verse?--the FCC lines are always busy.

Title 47 CFR, Part 15. This deals with low power transmitters. I'd suggest
getting a ramsey fm10a (I think). I've got one - it puts out a couple of mW,
and can be heard over 'dorm distances'. They provide a very thoughtful
guide as to what's legal and what's not, but it doesn't replace the CFR.

* CFR=Code of Federal Regulations, found at a large library near you!

hi, mitch wa4osr here in mobile, alabama...

my sharp pc-6200 was dropped and the lcd display
was damaged... upon taking the display apart, one
of the surface mount column drivers was cracked...
rendering the display unusable... therefore,
i am in desperate need of the lcd display panel...
the part numbers on the display panel are LM64N671
and 90D13145W ... both numbers are on the panel...
my pc-6200 is actually a pc-6220, which
i think indicates that it has a 20 mb hard drive...

i bought the pc-6220 used with absolutely *NO* docs...
it has the 2400 baud internal modem... i need *ANY*
info, but especially would appreciate a copy of the
owner/operator manual... i will gladly pay for
copies/postage...

if anyone can help with a source of the lcd panel or
with the docs please email me or call me collect
at the below numbers...

thanks for any help/leads...

731. Mars Observer radio frequencies?

Newsgroup: rec.radio.amateur.space
Date: 1994-05-18 17:53:38 UTC
From: jacob@altair.csustan.edu
Message-ID: <Cq0F1G.9MD@koko.csustan.edu>
Source record: 27486

Does anyone know the transmission frequencies of the Mars Observer space probe, the one that supposedly blew up? If it is indeen still transmitting, how difficult would it be to pick up the signal with ham gear? It seems top me that wh hams are in a unique position to prove once and for all if this machine is still working or not.

732. Eggbeater Antenna

Newsgroup: rec.radio.amateur.space
Date: 1994-05-18 18:26:46 UTC
From: ae517@FreeNet.Carleton.CA
Message-ID: <Cq0GKM.2Bw@freenet.carleton.ca>
Source record: 27485

There was a chap on this newsgroup about a month or so back who was inquiring as to the construction of the Eggbeater antenna. Just for his info, there is a short article in the May CQ magazine on page 29 that gives some detail.

Apparently, the two perpendicur loops are fed in the same manner as a turnstile antenna, ie 90 degrees out of phase. The author describes this as being close to isotropic in radiation pattern in free space.

I was under the impression, perhaps mistakenly, that a single loop had very little radiation parallel to the plane of the loop, c'est a dire, all the radiation was broadside to the loop. Could one of you antenna design mavens explain why is it that when two perpendicular loops are fed 90 degrees out of phase, it becomes an isotropic antenna.

As well, what numbers would one plug into Mininec to model this getup?

>working or not.

Maybe. JPL's Deep Space Network used 70m dish antennas to listen for MO.
What kind of antenna do you have?

-Greg

734. LUSAT-1 (LO-19): Telemetry reports needed !!!

Newsgroup: rec.radio.amateur.space
Date: 1994-05-19 01:14:07 UTC
From: lu7akc@asarin.ORG.AR
Message-ID: <gate.9D5Jmc1w165w@asarin.org.ar>
Source record: 27492

SB SAT @ AMSAT $LO19HELP2
LUSAT-1: News + Telemetry Needed!
On May 19th, from 03:23 to 03:38 UTC, LUSAT-1 command station (operated by Norberto Pennini, LU8DYF), had tried to start the satellite. This operation was unsuccessfull.

In the next passes, Norberto will restart the software load process.

PLEASE DO NOT USE THE SATELLITE !!!

Please note that the satellite will not be operational for regular users for the next 7 to 30 days period.

****
If you have ANY LUSAT-1 (LO-19) telemetry report for the period between May/17/94 at 02:00 and May/18/94 at 02:00 UTC, please send it to the LUSAT-1 command station, either via packet radio to LU8DYF @ LU8DYF.BA.ARG.SOAM and LU8DYF @ ANY ACTIVE SATELLITE, or via Internet to: lu8dyf@asarin.org.ar
****

We want to thanks LU8DYF and some other stations that, in a way or another, made possible this operation: LU1DBC, LU1FYZ, LU2FHE, LU2BDT, LU6DYD, LU7AKC, LU7DSU and LU8ENU.

73's de Eduardo Sweet, LU7AKC [G.R.A.P.S.]

: -Greg

greg -

the frequencies being looked for are vhf . . . they are tones that were
meant to be used for vlbi. a proposal here at jpl suggested that a yagi
antenna be mounted to the 70 meter dish (focused on the dish) to try to
pick up the signals . . . some engineers have snickered at the idea . . . i
doubt if any amateur would be able to receive the signals.

736. Shuttle sched. and retransmitting shuttle audio

Newsgroup: rec.radio.amateur.space
Date: 1994-05-19 03:48:16 UTC
From: keithm@wicat.com
Message-ID: <1994May19.034816.11712@wicat.com>
Source record: 27489

Some questions...

Does anyone have a schedule of planned shuttle flights
for the next few months to a year? If so, please e-mail
me.

What is the procedure for re-transmitting shuttle audio?
I know that some hams just re-transmit the audio from
NASA select TV from the satellite. Is this the correct
way? What about permission to re-transmit? I have heard
that NASA has given a blanket permission. Is this so?

Thanks for the info in advance.

: e-mail: hansky@physik.th-zwickau.de

RS-15 has not been launched. It may yet fly this year depending on
future schedule revisions.

The next ham satellite to launch is UNAMSAT, presently scheduled for
a June 15 lift-off onboard a Russian rocket.

There you have it. Another big NASA snafu. The darn thing has probably
been working fine all along, but the engineers are trying to hear a VHF
signal with an antenna for the HF bands. Typical.

741. Slipping Sat Ants

Newsgroup: rec.radio.amateur.space
Date: 1994-05-20 14:51:51 UTC
From: icumming@news.delphi.com
Message-ID: <2riiq7$q6j@news.delphi.com>
Source record: 27494

I am sick and tired of climbing my satellite mast to fix my
satellite antennas that have slipped on my fiberglass boom.
I have the KLM long crossed yagis (very long booms).
I have tightened the hell out of the bolts and am always
concerned about cracking the #*$%^^@ fiberglass.
I am somewhat new to satellite stuff ... have I missed
some obvious trick (or is everyone swinging around up there
swearing at their antennas?)
Thanks Ian KB1SG

742. Locating Author of Solar.Exe(Matthew Merrill)

Newsgroup: rec.radio.amateur.space

743. amsat mailing list

Newsgroup: rec.radio.amateur.space
Date: 1994-05-21 00:53:22 UTC
From: rsm@world.std.com
Message-ID: <Cq4nsy.lpI@world.std.com>
Source record: 27497

I would like to get on the amsat mailing list.
I sent in a reauest 3 weeks ago, but no response.
Any suggestions?

Also are there any other good mailing lists??
thanks
bob KA6NOC

744. Re: amsat mailing list

Message-ID: <2rkqmh$gk0@usenet.INS.CWRU.Edu>
Source record: 27498

(KA6NOC writes that he asked to join the AMSAT mailing list 3 weeks ago and has had no response)

I'm one week and holding now myself. According to the AMSAT journal, the list is administered by a human, not a machine, and response can be slow at times. But 3 weeks??

Anyhow, I'm glad it's not just me. I was afraid I'd bungled the request.

N9LTD

Gee, I guess no one in all of amateur radio owns a drill but me. :-)
Drill the mast and *pin* the antennas in place with a sheetmetal screw.
Works for me.

Gary

I am looking for the contact address to obtain info from amsat.org.

I've tried info@amsat.org and help@amsat.org, but both messages bounced.

Thanks.

Scott

Well, what NC1I/K1FO (ever wonder how they keep all those EME yagi pointing in the same direction?) did was to use custom clamps machined to match the boom/tubing diameter. The idea is to maximize the effective surface area.

I've found this works pretty well even with clamps made out of sheet aluminum or square aluminum tubing. I use a hole punch to make holes in sheet metal. For the latter I ended up using a file....

This approach doesn't weaken the boom with holes.

Hi all,

I am just curious if anyone has the program to decode telemetry
from DO-17. If so, where can I get it from?

Thanks in advance,
Jon

SB SAT @ AMSAT $ANS-140.01
AMSAT-NA COMMENTS TO NTIA

HR AMSAT NEWS SERVICE BULLETIN 140.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 21, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-140.01

AMSAT-NA Sends Comments To the National Telecomunications & Information Administration (NTIA)

The Radio Amateur Satellite Corporation has responded to proposals contained in a notice from the National Telecommunications and Information Administration (NTIA). That notice, entitled Preliminary Spectrum Reallocation Report, was released in February and was prepared pursuant to Title VI of the Omnibus Budget Reconciliation Act of 1993. In that Act, Congress mandated that the U.S. Government re-allocate to the private sector 200 MHz of spectrum below 5 GHz, 100 MHz of it below 3 GHz. Since Amateur Radio's use of the microwave bands is on a secondary basis to Government applications, mostly military, this proceeding could have a significant impact on our future access to these frequencies.

In its comments filed May 11 by AMSAT-NA VP for Government Liaison Perry Klein (W3PK), AMSAT-NA asked the NTIA for wider amateur and amateur-satellite service bands at 13cm than proposed in its Preliminary Report. It proposed that 2300 to 2310, 2390 to 2400 and 2402 to 2417 MHz be turned over to FCC for allocation to commercial users. In omitting 2400 to 2402 MHz from this re-allocation, NTIA noted amateur satellite use of this band. This would presumably leave 2400 to 2402 and 2417 to 245 MHz available to amateurs. The present 13cm amateur band consists of 2300-2310 and 2390-2450 MHz.

AMSAT-NA proposed a primary amateur/amateur satellite allocation of 2400-2410 MHz plus access to as much of the 2410 to 2450 MHz band as possible on a shared basis. In support of this request, AMSAT-NA cited the likelihood of greatly increased demand for amateur satellite operations in the 13 cm band in coming years, far more than can be accommodated within 2400-2402 MHz; the unsuitability of 2417-2450 MHz for amateur satellite downlinks because of interference from such devices as microwave ovens; and the need to coordinate amateur-satellite allocations internationally so that they are available on a global basis. In addition, AMSAT-NA proposed that a narrow band of 1-2 MHz, somewhere between 2300 and 2400 MHz, be allocated to the amateur service on a primary basis to accommodate the experimental weak-signal tropo and EME work now carried out around 2304 MHz.

AMSAT-NA comments were prepared by a group consisting of Perry Klein (W3PK), Ray Soifer (W2RS), Jan King (W3GEY) and Bill Tynan (W3XO).

[The AMSAT News Service (ANS) would like to thank this group for the material used in this bulletin.]

LO-19 & IO-26 OBC'S CRASH

HR AMSAT NEWS SERVICE BULLETIN 140.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 21, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-140.02

LO-19's & IO-26's On-board Computers Crash After A Single Event Upset (SEU)

It has been reported this week that LUSAT-OSCAR-19's On-Board Computer (OBC) had "crashed" after having experienced what is known in the aerospace industry as a Single Event Upset (SEU). This phenomenon is caused by high energy particles in space "effecting" changes in the "state" inside of memory chips and/or other electronic components. In simple terms, an SEU will change a bit from a "1" to a "0" or visa-versa in Random Access Memory (RAM) chips. All MICROSATs have software specifically desgined to handle this problem. However, this software is not "bullet-proof." The software can only correct one "state" change at a time. If two "state" changes occur simultaneously, there is a good possibility that they will occur in RAM memory locations that will eventually lead to an OBC "crash."

The problem with LO-19 was first noticed on 16-MAY-94 over Argentina when LU1JBR was working it then he noticed suddenly that the satellite simply "disappeared." On the evening of 17-MAY-94, LO-19's ground command station, operated by Norberto Pennini (LU8DYF) was able to successfully reset the OBC. AMSAT-LU ground station LU8DYF requests that all users of LO-19 to PLEASE REFRAIN FROM USING IT FOR SEVERAL WEEKS! The reloading of the software will take several weeks along with extensive tests to be performed to insure all is working properly. AMSAT-LU requests that if anyone was collecting telemetry between 17-MAY-94 at 02:00 UTC until 18-MAY-94 around 02:00 UTC that they please forward it to the following addresses: via packet radio to LU8DYF @ LU8DYF.BA.ARG.SOAM and/or LU8DYF @ ON ANY ACTIVE SATELLITE, or via Internet to: lu8dyf@asarin.org.ar. This will certainly assist in the recovery efforts by helping the AMSAT-LU group understand this crash. All users are asked to please be patient as the AMSAT-LU ground command team reloads the operating system software for LO-19.

Alberto Zagni (I2KBD) also reports that the the same high energy eruption that caused the LO-19's OBC to "crash" has also cause IO-26's OBC to "crash." I2KBD reports that the problem occured about the same time period and feels that this was due to the fact the Sun was spewing out alot of highly charged particles. I2KBD says that it will take several days to get the "kernal" and Integrated Housekeeping Tasks (IHT) software reloaded. He too asks that all IO-26 users to please be patient as they bring IO-26 back

"on-line."

Please stay tunned to the AMSAT News Service (ANS) bulletins for further status on the reloading and recovery of LO-19 and IO-26.

[The AMSAT News Service (ANS) would like to thank LU2DTZ, LU8DYF, and I2KBD for the information which went into this bulletin item.]

WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 140.03 FROM AMSAT HQ
SILVER SPRING, MD MAY 21, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-140.03

Weekly OSCAR Status Reports: 21-MAY-94

AO-13: Current Transponder Operating Schedule:
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 May 07-Jul 11
Mode-B : MA 0 to MA 170 |
Mode-BS : MA 170 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Alon/Alat 230/-5
Mode-B : MA 250 to MA 256 |
Omnis : MA 250 to MA 120 | Move to attitude 180/0, Jul 11
[G3RUH/DB2OS/VK5AGR]

FO-20: The analog mode will be continued indefinitely.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

KO-25: Please note that the KO-25 uplink was switched back to 145.980 MHz on about 10-May-94. [K6OYY]

AO-16: Working well. [WH6I]

LO-19: DON'T USE LO-19 UNTIL FURTHER NOTICE! [LW2DTZ]

IO-26: IO-26 has sustained a SEU and users are asked to refrain from trying to use it. [I2KBD]

KO-23: Operating Normally. [WH6I]

IO-26: Operating normally. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you

provide will be of value to all OSCAR enthusiasts.

As the maintainer of the "Elmers list" for this newsgroup (among others),
I too would be interested in this information. I know several people
who have AMSAT E-mail addresses, one or two being on the Elmers list
(such as Bob Carpenter, W3OTC), but don't have any official customer
service contacts for membership information, files, or mailing lists.

If you wish to submit information about AMSAT, or find out more about
the Elmers list and how to obtain a current copy of it, please finger
pschleck@unomaha.edu or send E-mail to elmers-request@unomaha.edu.

On a related subject, something that the moderator of rec.radio.info
(Mark Salyzyn, VE6MGS) and I are very interested in is who is relaying the
AMSAT-related bulletins like the Orbital Elements and Space News to the
Info-Hams@ucsd.edu gateway. What is currently happening is that their
respective maintainers are submitting them to Mark who cross-posts them
to rec.radio.amateur.space and rec.radio.info (which causes them to be
relayed to the Ham-Space and Radio-Info mailing lists), then they appear
on Info-Hams (rec.radio.amateur.misc). E-mail to the maintainers
reveals that they are not the ones doing the duplicate posting, a person
or persons unknown within AMSAT is.

It's certainly not our place to dictate how bulletins should be posted,
or even who should post them, but if they are going to posted to several
newsgroups, a simultaneous cross-post is most desirable (propagating a
single article within news that will appear in most modern newsreaders
only once, although it will be duplicated on the mailing lists). Also,
if there will be multiple submitters to news of bulletins with packet-radio
BID's, they should use the Message-ID encapsulation convention like the
following:

SB BID$NNN @ DISTRIBUTION

becomes:

Message-ID: <bid$nnn.1994@ampr.org>

In this way any one news site will have only one copy of the bulletin, regardless of how many submitters post it.

Mark is perfectly willing to help anyone manage the complexity in properly formatting their bulletins. This could be as simple as mailing it to a different E-mail address (rec-radio-info@ve6mgs.ampr.ab.ca instead of Info-Hams@ucsd.edu).

While rec.radio.amateur.space (and Ham-Space) is really the most appropriate target for these bulletins (based on their charters agreed to by a vote of the readership at the last newsgroup reorganization), in the interest of cooperation, we would be amenable to simultaneously cross-posting the AMSAT-related bulletins to rec.radio.info, r.r.a.space, *and* r.r.a.misc (as it's still only one article being propagated) if there is still a strong desire to relay these bulletins to their "traditional" mailing list (we realize that some of the conventions and procedures for relaying radio bulletins predate the rec.radio.info newsgroup and not everyone is going to adopt our recommended techniques overnight, if at all).

Mark and I would very much like to hear from individuals within AMSAT who are interested in using the net to publicize their organization and distribute their bulletins in the most invisible and bandwidth-efficient ways possible. An excellent forum for discussing some of these issues with Mark, myself, and about a dozen other experienced radio information maintainers on the Internet is the rec.radio.amateur Working Group mailing list (rra-wg). To subscribe, send E-mail to rra-wg-request@amdahl.com.

Hi all:
I have a couple of quick questions, if someone can point me to a FAQ which covers them, or perhaps just drop an e-mail message. I have been trying to work the MIR space station and two things have come up. First I am running STSPLUS and have obtained several sets of satellite element sets, I have noticed that the different element sets give different! orbit projections!!!! What's up?, are the element sets only valid for a finite amount of time? How often should one get updated lists? Secondly, I'm using a 1/4 wave ground plane antenna with about 25 W from an IC-27A, I can hear MIR on occasion is there anyway to verify that MIR could hear me? It seems to always be busy, when(if) I get the opportunity to connect I'd like to be sure that MIR can hear me. Thanks in advance for any help you can provide.
Mike

Mir is big, has lots of drag and is in a low orbit. It would have re-entered and burned up years ago if it didn't fire its rockets ever month or three to reboost itself back up into its proper orbit. The reboosting seems to be done with a series of burns spread over days or even weeks. Of course, every time the rockets are fired, the orbit changes, thus invalidating your orbital elements!

Best bet for Mir - get elements weekly from packet or internet.

By the way, according to Jonathan's Space Report, Mir reboosted last week.

Dave, N9LTD

P.S. For a real thrill, run the keps for the various PARTS of Mir - Crystal, Kvant, etc. Notice how, according to the Keps, these objects are up to several minutes apart, despite the fact that they are all bolted together!

MIR (and Shuttle) make frequent orbit adjustments. So you need new orbital elements frequently for these two. Other satellite orbits change less often, and less drastically, so you don't need to update their elements quite so frequently. During a Shuttle mission, you'll likely want to update your orbital elements *daily*. For MIR, you don't have to update that often unless they are in the process of docking a supply freighter, or making an orbital adjustment. Every couple of weeks is sufficient when only atmospheric drag is affecting their orbit. Most other satellites will only change orbit due to atmospheric drag, and most other satellites are in higher orbits than MIR or Shuttle, so their orbits change less rapidly. You may need new orbital elements for them only every three months or so.

>Secondly, I'm using

The only way you can be sure MIR's packet robot hears you is if you get a connect. If you've allowed for doppler shift, and if your tones are at 3 kHz or less, 25 watts should be sufficient. However, a groundplane isn't an ideal antenna for this purpose. You'd do better with a Lindenblad or Quadrafilar Helix. Still, with the right geometry, you should be able to make a connect.

Gary

755. Two-Line Orbital Element Sets (TLE399)

Newsgroup: rec.radio.amateur.space
Date: 1994-05-23 13:19:33 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.769699173@afit.af.mil>
Source record: 27509

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

|>projections!!!! What's up?, are the element sets only valid for a finite
|>amount of time? How often should one get updated lists? Secondly, I'm using

Yes, they are accurate for a finite amount of time. Orbital adjustments are made from time to time which really mess up the predictions as the orbit has changed. Plus the predictions are not 100% accurate. There predictions are based upon models and have a finite accuracy. The result is that for low orbit birds like MIR where you only get a 10-15 minute pass, you want element sets that are around 2 weeks old or so. Older ones might work, but since they are easy enough to get, keeping current is a good practice.

|>a 1/4 wave ground plane antenna with about 25 W from an IC-27A, I can hear
|>MIR on occasion is there anyway to verify that MIR could hear me? It seems to
|>always be busy, when(if) I get the opportunity to connect I'd like to be
|>sure that MIR can hear me. Thanks in advance for any help you can provide.

If you got back a Busy rejection from the MIR BBS, then you were heard! 25 W should do fine, but it really depends upon the amount of QRM. Since many stations try to work MIR at the same time, only one can get into the BBS. The rest end up being QRM that interferes with MIR's ability to hear the station that is connected. Always monitor the downlink and wait until the currently connected station disconnects. Otherwise you just contribute to the QRM.

73,
Todd

From Information Week, May 30, 1994:

"IN SHORT
Satellite Superhighway
Satellite transmission, rather than cable TV or optical fiber, could be the primary conduit for the information superhighway by the end of the century, says a new study by New York-based Deloitte & Touche. Satellites will offfer more channels and broader delivery because they are able to reach areas that are not wired to the national information infrastructure. The report, entilted "Speeding Toward The Interactive Multimedia Age", is available from Deloitte & Touche's Washington office".

That's cool. I hope some of this technology makes it to the Amateur Space efforts. TCPIP into a bird, with a full gateway to the main internet backbone.. from my backyard? Excellent!

760. AO-27 Success!

Newsgroup: rec.radio.amateur.space
Date: 1994-05-23 22:10:05 UTC
From: greg@core.rose.hp.com
Message-ID: <CqA08u.4C3@icon.rose.hp.com>
Source record: 27412

Hi, folks,

I finally was able to get into AO-27 this weekend! My problem before seems to be related to my Icom R-7000 receiver (plus an external preamp) not being able to hear the bird. I got a fine signal going into the 430 module in my base rig (Yaesu 767GX), so I thought I'd try running half duplex, and it worked! I still don't know how I sounded, but the reports were that I had a good signal. I was running about 30 watts into a homemade (poorly) 5 element beam at the end of 60' of RG-8.

The downlink is still a bit of a problem. The signal can go from full quieting to zip in a matter of a few seconds. I don't know if this is due to polarization, obstructions, atmospherics, or something else. My antenna is fixed in elevation at about 10 degrees, and horizontally polarized. It's an 8 element Quagi (better construction than the 2m beam, but still not perfect). Reception didn't really start until the satellite was well above the horizon (say, 25 degrees on a 45 degree pass), and it ramped quickly to a good level. Sorry, but I didn't check the S-meter. It wavered a bit, dropped out, came back, and then dropped out for good. That was again about 20 degrees up. With those elevations, and a 500 mi orbit, that makes for a real quick pass. The uplink antenna, BTW, is vertically polarized.

Thanks to all those who helped me get on this bird! Hope to hear you on an upcoming pass.

Greg KD6KGW

p.s. Any idea why my Icom R-7000 appears to be so deaf? I know the specs aren't as good as the Yaesu (.5uv vs .32uv sensitivity), but the 10db preamp should more than make up for it.

761. APT-Satellites: Report MAY 22, 1994

Newsgroup: rec.radio.amateur.space

762. Gear for starting satellite station

Newsgroup: rec.radio.amateur.space
Date: 1994-05-24 13:00:18 UTC
From: "Walter K. Daniel KE3HP" <wk02593@worldlink.com>
Message-ID: <2978870298.0.wk02593@worldlink.com>
Source record: 27414

Here are two approaches for starting a satellite station based on my experience of the past few years. Perhaps the most important beginning point is reading The Satellite Experimenter's Handbook (TSEH) from the ARRL.

1. Digital satellite reception, spacecraft telemetry

If you are mostly interested in receiving information from digital satellites, you can easily begin with DOVE (DO-17). The gear needed for DOVE will also allow you to receive SAREX, Mir, and AO-21 transmissions. Transmitting to the Shuttle or Mir is possible if you don't mind odd hours or if you invest in a beam antenna (see "You, too, can contact space!" by Michael Bass N7WLC/5 in the May/June 1993 issue of The AMSAT Journal).

The three components you need are a 2m FM transceiver, a 2m antenna, and a packet terminal node controller or TNC. I started off with an HT (Kenwood TH-27A, about $300 new), but any decent 2m FM rig will work. Start with an omnidirectional antenna such as a quarter-wave ground plane. You can build one (see TSEH for details) or buy one such as the MFJ-1740 for about $13. My first TNC was a PacComm HandiPacket portable, but any VHF TNC such as the MFJ-1270 (about $120) is fine. Of course, you need a computer to use with the TNC.

DOVE transmits packet telemetry and messages on 145.825 MHz. You can also receive traffic from the Mir packet mailbox on 145.55 MHz. In recent years, the cosmonauts haven't been using voice much, but you're suitably equipped if they do. The Shuttle sometimes carries SAREX (Shuttle Amateur Radio Experiment) and can transmit packet or voice on 145.55 MHz. In addition to its FM repeater and digital voice downlinks, AO-21 has been transmitting some packet telemetry on 145.987 MHz recently. Finally, you can also work terrestrial packet and 2m voice for repeaters and nets.

If your long-term goal is to work the Pacsats, you can plan ahead for 9600 bps FSK operations. Some of the new FM rigs have 9600 bps modem connectors so you don't have to perform surgery on the radio. You can buy a PacComm TNC with the 9600 bps modem installed for a bit over $200, not too much more than the cost of a TNC. The versatile DSP boxes cost much more (over $500), but offer capabilites to work many digital modes including 9600 bps FSK.

2. Analog (voice and CW) operation

If you are mostly interested in speaking to or exchanging CW with other hams, try RS-10 Mode A and/or RS-12 Mode K. For more details, see my article "Getting Started with RS-10" in the August 1993 QST or the article by Robert Capon WA3ULH "Working Satellite RS-12..." in the February 1994 QST.

For reception of either satellite, any HF or 10m rig will work. I have a used Uniden HR-2600, but you can still buy them new for $200. A 10m dipole

antenna works well--build your own or buy one (about $20). To transmit to RS-10, you need a 2m rig with CW and USB modes. These rigs are not as common as FM rigs and cost a bit more. My Kenwood TR-751A cost about $600 new. To transmit to RS-12, you need to use the 15m band. The RS-12 transponder input lies in the Advanced/Extra class subbands, so make sure you have the privileges before you transmit.

The RS-10 CW beacon at 29.357 MHz is strong. The RS-12 CW beacon is also strong at 29.408 MHz. Operation on these satellites is full duplex (you hear yourself from the satellite), so headphones are necessary. If you have a 2m multimode rig like I do, you can work other non-satellite modes: 10m voice or CW, 2m FM voice for nets and repeaters, 2m terrestrial packet with a TNC, and terrestrial 2m SSB or CW weak-signal operation.

The addition of a 70cm antenna ($60 for a small yagi) and a 70cm-to-10m downconverter (about $100) will turn a Mode A station into a Mode JA station.

The only satellite currently operating JA is FO-20, but Phase 3D will likely spend some time in this mode. The addition of a PSK modem (about $200) and TNC ($120) brings Mode JD capability for the 1200 bps Pacsats. Alternatives include the combined PacComm TNC/PSK modem (about $270) or a DSP box.

73, Walt KE3HP

* LUSAT-1 CRASH RECOVERY UNDERWAY *
==================================
On 16-May-94 while LU1JBR and other stations were operating LUSAT-1 (LO-19), the satellite's downlink vanished, a result of an on-board computer crash. By 17-May-94, LUSAT-1 command station (operated by Norberto Pennini, LU8DYF), successfully reset the satellite.

Norberto will start a series of deep tests and studies in order to find the origin of the crash. Reloading of operating software will follow the study. Please note that the satellite will not be operational for regular users for the next 7 to 30 day period.

LUSAT-OSCAR-19 controllers would like to thank LU8DYF and other stations who, in a way or another, collaborated and made this operation a success, including: LU6DYD, LU7AKC, LU7DSU, LU8ENU, LU4AGC, LU1EXC, LU2BDT, LW1EEO and LU3AGY.

[Info via Eduardo Sweet, LU7AKC]

* AMSAT CALL FOR PAPERS *
=========================
Share your experience with the amaeur satellite community at the 1994 AMSAT-NA Annual Meeting and Space Symposium scheduled for 07-Oct-94 through 09-Oct-94 in Orlando, Florida. Come help celebrate AMSAT's 25 year

presence in Space. Your help is needed to make this meeting a success.

Papers for this meeting are sought. Editing, formatting, graphics and even typing can be provided if required. Prepare a paper and advance your reputation among others involved in the Amateur Satellite program! Even if you cannot attend the meeting, consider a paper for publication.

Topics for all amateur satellite disciplines are sought. Author and Title requested ASAP. Compose a short abstract by July 1. Final drafts are requested on or about August 26.

Direct inputs and inquiries to:
Steve Park - WB9OEP
12122 99th Ave. N.
Seminole, FL 34642
Phone: (813) 391-7515
Internet: SKPA@QMGATE.ECI-ESYST.COM
Amateur Packet Radio: WB9OEP @ W4DPH#TPA.FL.EL87OW

Join us in Orlando, Florida for the fun and festivities!

[Info via Steve Park, WB9OEP]

* CLEMENTINE FAILURE *
==========
After successfully completing a mission using advanced ballistic missile defense technologies to map the entire surface of the moon, the Ballistic Missile Defense Organization's Clementine satellite suffered an on-board malfunction at 9:39 AM EST on 07-May-94. The likely result of this malfunction will be to prevent Clementine from performing the planned close fly by of the near-Earth asteroid Geographos in August 1994, and for the satellite to point its cameras and sensors.

Preliminary analysis has traced the cause of the malfunction to the on-board computer which controls most of the satellite's systems including the attitude control thrusters. The computer activated several thrusters during a 20 minute telemetry interrupt with the ground station, thus depleting all the fuel in the Attitude Control System (ACS) tanks. It has not been determined as yet whether the fault was in the computer software or in the computer's electronic chips. The primary processor on the computer is a radiation hardened Military Standard 1750A computer, which is not experimental technology.

Clementine's mission control center in Alexandria, VA. is continuously monitoring the satellite. It has been determined that all instruments and systems are continuing to function well with the exception of the ACS.

Although it may be difficult to Clementine to make the close fly by of the asteroid, the satellite will continue to perform its intended military mission to test 23 advanced technologies. The Clementine engineering team is examining several mission options which would continue to yield useful data. Since January 25, 1994, Clementine's cameras have recorded over 1.5 million images including the topographical surface of the moon. Analyzing

this data, including results of the search for the existence of ice on the lunar surface, will continue to occupy scientists for many years.

The Clementine project is managed by BMDO, built by the Naval Research Laboratory, and its instruments constructed by industry and the Lawrence Livermore Laboratory. It has been a landmark project since it demonstrates that small, highly capable satellites can be built and launched for under $100 million and in less than two years, using advanced miniaturized technology and a streamlined management approach.

[Info via Richard H. Buenneke Jr.]

* DISCOVERY OF ASTEROID MOON *
==========
NASA's space probe Galileo has discovered what is probably the first known moon of an asteroid. Since Galileo passed the asteroid, Ida, on August 28, 1993, the probe has continued to send back images and data from the near infrared mapping spectrometer. Because of the great distance at which the probe is from Earth, downloading this data will continue for months to come.

The Galileo Porject Scientist, announced on March 3, 1994, the discovery of a "blip" consisiting of more than a few pixels visible in data from both the solid-state imaging system and the spectrometer.

Based on simultaneous observation, a natural moon may be in orbit around Ida. If so, this would be the first satellite of an asteroid to be discovered.

More information will be forth coming soon from NASA, along with the first images of this possibly new moon orbiting Ida.

[Info via Dave, N9JUW]

* ECLIPSE IMAGE AVAILABLE VIA FTP *
==========
A collection of images taken of the 10-May-94 annular solar eclipse have been assembled into a single file and is available via anonymous FTP at: ftp.uleth.ca (IP # 142.66.3.29). The image is called "eclipse.gif" and is located in the "pub/solar/Images" directory at this site. The frame contains 24 high-quality images taken by the Big Bear Solar Observatory. All but three are full-disk hydrogen-alpha and Ca II K images, giving excellent views of existing features visible on the Sun (regions of enhanced plage, filaments, etc). The other three images are high-resolution close-up images of the Sun showing craters and mountain ranges against the background of the solar surface. "eclipse.gif" is a large 1500 x 1297 x 256 image that will make good use of large high-resolution monitors.

The folks at the BBSO did a great job capturing these images, and deserve a nice pat on the back for covering the event so well.

"eclipse.gif" is in a semi-permanent state. That is, it will not be removed from the FTP disk for a few months.

[Info via Cary Oler]

* RS-10 NEWS *
==============
VE3CIQ in Canada reports that RS-10 is working quite well in Mode A. In one Atlantic pass, he made contact with FG5GI from Guateloupe Island, ON2ATB from Belgium, and N1MCT from Maine, USA using 25 watts of transmitter power. VE3CIQ reports he can hear himself with only 5 watts.

Cross-posted to:
can.schoolnet.space.jr,can.schoolnet.space.sr,ists.space,rec.radio.amateur.space,tor.general,ont.general,york,general

Dear Space Enthusiast:

I would like to take this opportunity to invite you to attend the International Space Development Conference, the National Space Society's 13th annual conference, which will be held in Toronto from May 26 to 30, 1994 at the Regal Constellation Hotel. Attendance is anticipated at 500-1000.

This is a four day conference where space experts from industry, governments, the general public, professional organizations, and educators come to see and share the latest in space projects and plans. Much of the focus of the conference is on the more speculative aspects of long term space travel and the human "outward urge" which will propel our species to the planets and to the stars. Apollo astronaut Buzz Aldrin; Roland Dore, President of the Canadian Space Agency; Bob MacDonald, host of CBC's Quirks and Quarkrs, as well as Canadian astronauts Ken Money, Mike McKay, and Chris Hatfield are keynote speakers.

ISDC94 features talks on space medicine, education, and technology, an art show, a special Kids Conference, Internet Friday, and Rocket Workshops.

Registration is $90 USA/ $110 CDN at the door; the student and senior rate is $30US/ 35 CDN.
The day pass rate is 1/3 door rate.

ISDC hotel rates are: $ 87 CDN/ 67 US for a single or double room, and $97.00 CDN for triple/quad occupancy.
Hotel reservations can be made by calling: (416) 675-1500 or toll free at 1-800-268-4838.

For further information on ISDC94, you can contact one of the organizers listed below:

Paul Swift (416) 695-3343 pswift@caisu.ists.ca
Christine Marton (416) 699-0591 marton5@vrg.utoronto.ca
Wayne Sincarsin (416) 889-0327
Chris Coggon (416) 665-5413 coggon@ists.ists.ca

765. LUSAT-1 (LO-19): Actual status

Newsgroup: rec.radio.amateur.space
Date: 1994-05-24 15:24:30 UTC
From: lu7akc@asarin.ORG.AR
Message-ID: <gate.J4gumc1w165w@asarin.org.ar>
Source record: 27416

Official LUSAT-1 Status Report

The satellite LUSAT-1 seems healthy. The software load was intentionally stopped when the second module was just loaded and turned on.

The next step will be to continue with the satellite's deep tests.

The satellite is sending telemetry on 437.125 MHz and it's digipeater is turned on.

Overseas stations: If you capture any LUSAT-1 telemetry and send it in raw-mode to the satellite control station, you'll receive a certificate for your collaboration. These telemetry reports can be sent either via packet radio to LU8DYF@LU8DYF.BA.ARG.SOAM and LU8DYF@ANY-ACTIVE-SATELLITE, or via Internet to: lu8dyf@asarin.org.ar

If you intend to use the satellite, please remember that the BBS is NOT LOADED and it will NOT be operational for the next 3 weeks (approx.).

We want to thanks LU8DYF and all the other stations that helped in the LUSAT-1 recovery: LU1DBC, LU1EXC, LU1FYZ, LU2BDT, LU2FHE, LU3AGY, LU4AGC, LU4FIO, LU6DYD, LU7ABF, LU7AKC, LU7DSU, LU7XAC, LU8ENU and LW1EEO.

Hey everyone. Since HF is in the pits now, I'm thinking about getting into satelites, since the VHF in my area (New York City) stinks, and my all band dipole is on the ground (no 40 or 80 meters) which leaves me with my 3 element tri-bander. I've been playing with RS-12, since it's the only one I know of right now that is an all-HF bird. The only problem is that even on a direct pass, the most I can get is 17 or so minutes, and only 13 or so are decent. I would like to start with the SSB and CW VHF/UHF birds. I have the following questions:
1. What rig should I look into getting? I'm thinking about the new Icom all-mode 2m/440 (Can't remember model #...it was in the latest QST) Any hints?

2. Antenna wise, any ideas? I have a tri-band Yagi on the roof now on a regular mid-sized rotor. I was thinking about getting so moderate sized 2m/440 yagis, but what kind? Should I invest in an alt/az rotor...that is a big investment in both time and money, since I'd have to put another tower up on the roof...What kind of antennas should I look for?

Anyway, that's just the beginning. Any helpful information would be greatly appreciated! Thanks...

Well, it's brand new, so there's no history on it yet. The rig most frequently heard on the satellites is the Yaesu FT736R and it's older cousin the FT726R. Those are followed by the fancy IC970 and the Icom separates, IC275 and IC475. The newest Icom rig *looks* promising, but we don't know how well it actually works yet. If you get one, let us know. :-)

(The one rig I'd steer you *away* from is the Kenwood 790. It can work, but it's an ergometric nightmare. The thermal design of the radio is also bad. It gets real hot real quick because the output bricks aren't well designed or matched. If you operate it throttled way back to drive external amps, it may do OK.)

>2. Antenna wise, any ideas? I have a tri-band Yagi on the

Alt-Az rotators are a must for serious satellite work. You can save some money by buying only a KR-500 elevation rotator and mounting it just above your tri-bander at *right angles* to the tri-bander's boom. This will allow the VHF/UHF beams to elevate with their rear sections coming down *between* the tri-bander's elements. Just remember that your azimuth rotator is 90 degrees off when using the satellite beams. (You'll get less than 90 degrees elevation using this method before the VHF/UHF beams hit the boom, but that's workable.) It's better to have fully dedicated alt-az rotators free of HF beam interference, especially if you're considering auto-tracking. But, of course, that costs more money and means some re-engineering of the tower mechanics. IE you can use a tall enough mast to put the beams high enough above the tri-bander to allow full motion, but that makes them much more susceptable to wind damage.

Better is to re-install the tri-bander down the tower a bit using a Ring-rotor to walk the beam *around* the tower. Or you can use a separate tower. Remember, your antennas spend most of their time looking up, so a tall tower isn't essential. All you really need is a mast tall enough to allow the antenna's rear elements to clear

the ground when at 90 degrees elevation. A taller tower can be helpful when the satellite is near the horizon and you have local obstructions to clear.

As to which beams, the KLMs are by far the favorites. The KLM22C and KLM40CX are preferred. Use good mast mounted preamps. It's usually best to use a very low loss transmit coax and a separate receive coax with switching on the tower. Thanks to the preamp, the receive coax doesn't have to be anything special. Doing it this way, you're less likely to burn up a preamp if you transmit a blip of RF at the wrong time.

Thanks for this posting. I was just thinking about trying Satellite
out and after your post yesterday I went home, found and read the
Feb. 1994 QST article.

I was able to find the beacon fine and as it started to get strong
I looked around the receive band and found someone calling CQ on
21,230. I set my Tx to 29,430 and tried to respond but wasn't able
to make contact.

I had the feeling that I wasn't close enough to the frequency that
was hearing and that other were so they were able to make a contact
where I couldn't. Are there any hints or tricks for better choosing
the Tx frequency ? I'm ready to try again tonight.

Bill

Bill,

If you're trying to get into RS-12, the uplink frequency is in the 15 meter band, and the downlink is in the 10 meter band. Looks like you have them switched. I believe the downlink is from 29.410 - 29.450, with the beacon at 29.407. I don't know how you heard the beacon on 15 meters...
The person calling CQ was probably heard on the way up, not down. You could have worked him simplex, but that wouldn't be as much fun.

The easiest way to "find yourself" is to find an open spot in the downlink window to park your receiver, then set the transmitter to where it would be if there wasn't any doppler. If you're, say, 20khz down from the upper pass band (29.430), set your transmitter 20khz down from whatever the uplink window is. If I recall correctly, the last two digits in the frequency will match on the RS satellites. From that point, send a series of dits, say something, or in some way transmit a recognizable signal and *slowly* move the *transmitter* frequency up until you hear your own signal clearly. With RS-12 you shouldn't have to move it very far, a few KHz at most. My passes with RS-10 usually start at 29.380 downlink and 145.880 uplink (note the matching 80's) and depending on the pass I'll hear myself between 145.882 and 145.885.

Good luck, and enjoy!

770. Motorola GPS engine purchase information

Newsgroup: rec.radio.amateur.space
Date: 1994-05-25 18:22:04 UTC
From: bonomo@specxn.enet.dec.com
Message-ID: <1994May25.182204.12821@nntpd2.cxo.dec.com>
Source record: 27421

Greetings, one and all!

This message is ASCII text, formatted as <CR> at =<78 characters, tabs at +8.

Have finally received "everything" which I will obtain from Motorola and Trimble, and the order requests have dwindled to a minimum, I have attached the specifications and pricing below.

In a nutshell, the Motorola unit is better in every way, excepting three factors. The Trimble unit:

1) is about 1/8" smaller in width and height,
2) is about .6 ounce lighter,
3) consumes less power in standby, quoted as ~2uA nominal, versus the Motorola's stated maximum of 60uA.

Other than that, the Motorola VP Oncore engine is superior in all ways, including price. The recommendation, from my perspective, is to choose the Motorola unit, but your choice may vary. The above factors, in which the Trimble unit is superior, may be significant ones for you.

I have had requests from 375 individuals, from nine countries, for over 435 units. All this is, of course, based on a "$150" purchase price, which is not available.

Understanding this, it seems best if there is a "standard" configuration which is ordered, as the pricing given is for quantities of 100 and greater. If 100+ want the options, we'll order those, too. Remember, all prices are for 100+ units per item. In other words, if 25 units are wanted with the LNA option, the pricing for that LNA option will be be somewhat higher than the figure quoted below, and I'm not sure if Motorola can (or will) handle one-sie, two-sies and get it right.

****
The recommended "standard" configuration:

Item Price / each (includes Colorado State sales tax)

VP Oncore engine $268
Active Antenna $ 70
Cable to antenna $ 22

Total "standard" $360

****

Options to be considered:

LNA $ 16
battery $ 11

Shipping within the continental U.S., via 2nd day service, will run $10. This includes a box, packing foam and shipping charges. This figure is good for up to ten units.

Those interested in this group purchase should remit monies to the name and address below. Please send non-cash such as personal checks, money orders or the like, as it allows records to be kept much more easily. If less than 100 orders are placed, the checks/money orders will be destroyed, rather than incurring the cost of returning up to 100 of them. Alternately, if you want your check returned in the event of an insufficient number of units ordered, add a dollar bill to cover the cost of an envelope, stamp and my or my wife's writer's cramp which will inevitably result. If the order threshold is reached and an order is placed with Motorola, the $1 will be returned to you with your order. Please include a very complete address to which the order may be sent. Include your current Internet address and telephone number(s) where you may be reached, as well. I've experienced several Inet addresses which have bounced, by the way, so if you didn't receive a response from me directly, it was attempted.

Send orders to:

Thomas A. Bonomo
8147D Summerset Drive
Colorado Springs, Co. 80920.6123

I can be reached, and have been by several individuals, at:

Telephone: (719)593.9883 Home (evenings, weekends)
(719)592.5105 Office (weekdays)
Internet: tom.bonomo@cxo.mts.dec.com

This message will be posted to the newsgroups, as well.

Thanks for your patience as I've gathered information and responded to each of your requests.

Regards,

Tommy

Specifications and pricing information follows.

Motorola VP ONCORE SPECIFICATION DATA SHEET

Receiver Architecture
----
o 6 channel

o L1 1575.42 MHz
o C/A code (1.023 Mhz chip rate)
o Code plus carrier tracking (carrier aided tracking)

Tracking Capability
---
o 6 satellite vehicles simultaneously

Dynamics
---
o Velocity: 1000 m/s when altitude less than 18 km
o Altitude: 18 km for velocities greater than 514 m/s
o Accelleration: 4 g

Antenna
---
o accepts active and passive antennas

Acquisition Time

(TTFF = Time To First Fix)
o 22 sec. typical TTFF (with current almanac, position, time and ephemeris)
o 48 sec. typical TTFF (with current almanac, position and time)
o 2.5 seconds typical re-acquire

Accuracy
---
o Position: less than 25 meters, SEP (without SA).
DoD may invoke Selective Availability (SA), potentially degrading accuracy to 100 meters (2 dRMS)

DATUMs
---
o 49 std. datums, 2 user defined, default WGS-84

Signal Level
---
o TTL

Output Messages
---
o Latitude, longitude, height, velocity, heading, satellite tracking status (Motorola Binary Protocol)
o NMEA-0183 Version 2.00 (GGA, RMC, GLL, GSA)
o LORAN emulation mode
o Software selectable

Operating voltage
---
o 4.75 - 5.25 VDC, 50 mVp-p ripple

Operating current
----
o 230 mA typical @5V, 275 mA max at 5.25V

Standby voltage
----
o 2.5 - 5.0 VDC

Standby current
----
o 60 ua max

Dimensions
----
o 2.00" x 3.25" x .64" (50.80mm x 82.55mm x 16.26mm)

Weight
------
o 1.9 oz. (53.9g)

Connectors
----
o Digital: 10 pin (2 x 5) header on .100" centers
o RF: right angle OSX (sub-miniature snap-on)

Operating Temperature
----
o -30 - +85 degrees C (without on-board battery)
o -20 - +60 degrees C (with on-board battery)

Storage Temperature
----
o -30 - +85 degrees C (without on-board battery)
o -20 - +60 degrees C (with on-board battery)

Humidity
----
o 95% RH, non-condensing

Vibration
----
o 7.7 g, random (survivability)

MTBF
----
o >61,000 hours (estimated)

Optional features
----
o Lithium battery
o Low Noise Amplifier
o Real Time Clock

Pricing (includes Colorado state sales tax)

VP Oncore engine $268
Active Antenna $ 70
Cable to antenna $ 22
Low Noise Amp $ 16
Lithium Battery $ 11

Development Software
1st option $270
includes:
Raw code phase,
disc data,
smooth sat time,
carrier phase

2nd option $215
includes:
above without
carrier phase

Specifications for Trimble SVeeSix GPS engine

Model: SVeeSix-CM2

General

L1 Frequency, C/A code (SPS), 6 channel, continuous tracking receiver

Update Rate

NMEA - 1Hz

Accuracy

Position: 25m without SA
Velocity: 0.1m/s without SA
Time: 1 us (nom)

DGPS Accuracy

Position: 2m to 5m (2 sigma)
Velocity: 0.1m/s
Time: 1 us (nom)

Acquisition (typ)

Cold Start: 2 to 5 minutes
Warm Start: 50 sec with time upload
Hot start: 30 sec with time upload

Reaquisition

<2 sec

Dynamics

Velocity: 500 m/sec max
Acceleration: 4g
Jerk: 20m/sec^3

Environmental Specs.

Operating temp: -10C to +60C
Storage temp: -55C to +100C
Vibration: 0.008g^2/Hz 5Hz to 20Hz
0.05g^2/Hz 20Hz to 100Hz
-3dB/octave 100Hz to 900Hz

Operating Humidity: 5% to 95% RH non-condensing @+60C
Altitude: -400m to +18000m

Physical Characteristics

Dimensions: 3.25" x 1.83" x 0.58"
Weight: 1.3 oz. (36.4g)
Connectors: RF: SMB, I/O: 8 pin (2x4), 2mm header

Technical Specifications

Prime power: +5Vdc (-3% to +5%)
Power consumption: 280 ma, 1.40 watts
Backup power: +3 to +5 Vdc
Backup consumption: 1 uA @3V and +25C (nom)
Serial port/1PPS: CMOS TTL
Protocol options: TSIP @9600 baud, 8-O-1
NMEA 0183 v2.0 @4800 baud, 8-N-1
TAIP @4800 baud, 8-N-1

NMEA messages: Standard: GGA,VTG
Optional: GGA,GLL,VTG,ZDA,GSA,GSV,RMC

Pricing (includes Colorado state tax)

SVeeSix CM2, DGPS capable $321
Antenna (includes cable) $118

Dennis for what it is worth I had the Hygain sat antenna set and my buddy down the road had the KLM's. Get the KLM's better build and polarization switch worked much better and did not change in the rain. The hygain's I had were useless when wet the SWR when up above 3:1. I also have m^2 hf antennas and they are great electrically but only so so mechnically.

SB NEWS @ AMSAT $SPC0531
* SpaceNews 31-May-94 *

BID: $SPC0531

=========
SpaceNews
=========

MONDAY MAY 31, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* DOVE STATUS *
===============
KA3AFY copied the following packet frame from DOVE-OSCAR-17 on 24-May-94:

DOVE-1>BRAMST [05/23/94 22:29:58]:
5/23/94
Software loading in progress
S-band is off
DOVE Command Team (WD0E)

At 5/25/94 0525Z DOVE controllers loaded and executed test software designed to assure the operation of the voice module after several months of dormancy. A brief test of the voice capability generated only garbled voice, so it was turned off. They are investigating possible causes, and at this point believe it is a software problem, not hardware.

For the next few days DOVE may be in various modes as controllers continue testing and/or loading new software. The S-band transmitter will remain off. Telemetry reports are not needed at this time.

[Info via Jim White]

* LUSAT-1 STATUS REPORT *
=========================
Controllers report that LUSAT-1 appears healthy after experiencing an OBC software crash. The software load was performed as part of the recovery effort was intentionally stopped after the second module was loaded and turned on. The next step of the recovery will involve continuing with the satellite's deep tests.

The satellite is sending telemetry on 437.125 MHz and it's digipeater is turned on. The BBS, however, is unavailable for use since the BBS software is NOT loaded on the satellite. The BBS will not be operational for the

next 3 weeks (approx.).

Those who send LUSAT-1 overseas telemetry reports (in raw format) will receive a special certificate for their collaboration. The telemetry reports must be sent via the Internet to <lu8dyf@asarin.org.ar> or via packet radio to LU8DYF @ LU8DYF.BA.ARG.SOAM or via satellite to LU8DYF @ any-active-satellite.

LUSAT controllers would like to thank LU8DYF and all the other stations who helped in the LUSAT-1 recovery, including: LU1DBC, LU1EXC, LU1FYZ, LU2BDT, LU2FHE, LU3AGY, LU4AGC, LU4FIO, LU6DYD, LU7ABF, LU7AKC, LU7DSU, LU7XAC, LU8ENU and LW1EEO.

[Info via Eduardo Sweet, LU7AKC of the LUSAT-1 recovery team]

* SpaceNews AVAILABILITY *
==========
Steve Diggs, KB4ZTN, reports that SpaceNews is now available on his "Top Of The Rock BBS" in Lilburn, Georgia, about 15 miles outside of Atlanta. Each issue of SpaceNews is received automatically from the amsat.org server via the Internet, saved as an ASCII file, named as the bulletin ID with a .TXT extension, and posted as a new upload.

The telephone number of the Top Of The Rock BBS is (404) 921-0315.

* MIR DIAGRAM *

* REPORT FROM DL3HRT *
==========
Karsten Hansky, DL3HRT, reports that he is active on RS-10 and monitors the satellite especially during passes in range of North America, but hears few signals. He has worked VE2AYT and K1QPM so far. Both stations come in with good signals (559). Karsten has also worked CN8ST and has heard a TU4-station on the satellite.

DL3HRT recently made a test and heard his own downlink signals using an uplink power of just 300 milliwatts fed into a 9-element yagi. He feels this success should encourage others to try RS-10 Mode A operations.

In other news, Karsten, along with Matthias, DL3HZM, have created a satellite tracking program called "sat09may.exe" that is available via anonymous FTP at igel.physik.th-zwickau.de in the /pub subdirectory, and pilot.njin.net in the /pub/SpaceNews/software subdirectory. An older version is available from the Simtel directory at oak.oakland.edu.

* THANKS! *

780. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1994-05-28 00:18:33 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.770084313@afit.af.mil>
Source record: 27430
Cross-posted to: rec.radio.amateur.space,rec.radio.info

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.info on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (also updated daily) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a eleven-character name.

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

782. LUSAT-1 (LO-19): Actual status

Newsgroup: rec.radio.amateur.space
Date: 1994-05-28 14:16:57 UTC
From: lu7akc@asarin.ORG.AR
Message-ID: <gate.Vms2mc1w165w@asarin.org.ar>
Source record: 27428

Official LUSAT-1 Status Report

The satellite LUSAT-1 seems healthy. The control station is actually performing some tests to the satellite.

The satellite is sending telemetry on 437.125 MHz and it's digipeater still turned on.

Overseas stations: If you capture any LUSAT-1 telemetry and send it in raw-mode to the satellite control station, you'll receive a certificate for your collaboration. These telemetry reports can be sent either via packet radio to LU8DYF@LU8DYF.BA.ARG.SOAM and LU8DYF@ANY-ACTIVE-SATELLITE, or via Internet to: lu8dyf@asarin.org.ar

If you intend to use the satellite, please remember that the BBS is NOT LOADED and it will NOT be operational for the next 3 weeks (approx.).

The LUSAT-1 recovery team want to thanks all the stations that sent LUSAT-1 telemetry data in RAW format.

The overseas stations that are going to receive the Special Award are:

1) Mr. Norimasa Okamoto (JN2LHU) from Gamagori city, Japan.

73's de Eduardo Sweet, LU7AKC (LUSAT-1 recovery team)

packet: lu7akc@lu7akc.#col.cf.arg.soam
e-mail: lu7akc@asarin.org.ar

784. V4.2b of OH5IY's MS S/W

Newsgroup: rec.radio.amateur.space
Date: 1994-05-29 22:59:48 UTC
From: jsi@vipunen.hut.fi
Message-ID: <2sb6p4$nj6@nntp.hut.fi>
Source record: 27438

V4.2b of OH5IY's meteor scatter software is available at ftp.funet.fi:
/pub/ham/vhf-work/mssof42b.zip

A bug found in transmit mode of v4.2 has been fixed in v4.2b (The program
moved to "calls only" when moving from "report" to "R report" stage. This
can be overcomed in v4.2 by using the "text input" (F7) at this stage).

V4.2b contains also msdata files of this year's April Lyrids and Eta Aquarids
meteor showers.

Meteor 2-21: APT 137.85 On
Meteor 3-5: APT 137.85 *OFF*

VHF-conflict NOAA-10/NOAA-12 continues, N-10 APT is off.
Meteor 3-5 APT is off too. APT-frequency of Meteor 2-21
changed from 137.40 MHz to 137.85 MHz, but the signal is
weak as always.
As Meteor 3-5 is off, old NOAA-9 now is the best source
for good vis-images.

Thanks for the posting. One thing I was wondering:

Is it worthwhile to have 70cm CW/SSB transmit capability, or
is a 70cm receive converter suffcient? I know that you can
work AO-13 with the 70cm uplink, but that satellite won't be
around much longer, and I don't know which other satellites
are actually used in the "70cm up - 2M down" analog mode.

Last-modified: $Date: 1994/01/02 22:00 $
Version: $Revision: 1.06 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

< Dated information here >

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat

transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

789. LUSAT-1 (LO-19): Actual status

Newsgroup: rec.radio.amateur.space
Date: 1994-05-31 12:49:06 UTC
From: lu7akc@asarin.ORG.AR
Message-ID: <gate.Jk97mc1w165w@asarin.org.ar>
Source record: 27447

Official LUSAT-1 Status Report

The satellite LUSAT-1 seems healthy. The control station is actually performing some tests to the satellite.

The satellite is sending telemetry on 437.125 MHz and it's digipeater still turned on.

Overseas stations: If you capture any LUSAT-1 telemetry and send it in raw-mode to the satellite control station, you'll receive a certificate for your collaboration. These telemetry reports can be sent either via packet radio to LU8DYF@LU8DYF.BA.ARG.SOAM and LU8DYF@ANY-ACTIVE-SATELLITE, or via Internet to: lu8dyf@asarin.org.ar

If you intend to use the satellite, please remember that the BBS is NOT LOADED and it will NOT be operational for the next 2 weeks (approx.).

The LUSAT-1 recovery team want to thanks all the stations that sent LUSAT-1 telemetry data in RAW format.

The overseas stations that are going to receive the Special Award are:

1) Mr. Norimasa Okamoto (JN2LHU) from Gamagori city, Japan.
2) Mr. Bent Bagger (OZ6BL+OZ7SAT) from Denmark.

73's de Eduardo Sweet, LU7AKC (LUSAT-1 recovery team)

790. SAREX School Sked Info, Pls

Newsgroup: rec.radio.amateur.space
Date: 1994-05-31 15:57:43 UTC
From: rapw20@email.sps.mot.com
Message-ID: <1994May31.155743.18422@newsgate.sps.mot.com>
Source record: 27442

One of the local schools has asked our club to help them apply for a SAREX sked and then to help with the actual contact, assuming it's granted. Apparently, one of the crew members is the uncle of a couple of the students at the school. I'm not sure at the moment exactly which shuttle mission they're interested in but I think it's early next year. We have the application and there shouldn't be any problems with technical expertise but what else should they (the school) send in with the application? I would think some kind of proposal that addresses how they intend to fit it in with the curriculum would be in order. Can anyone offer any advice on how to proceed with this?

I'd be interested to hear from anyone who has participated in a SAREX school sked. Any info (logistical, technical, etc.) will be appreciated.

Thanks & 73... Mark AA7TA

791. DSP opinions needed

Newsgroup: rec.radio.amateur.space

Hi, Mark. I helped the Raleigh Amateur Radio Society with a successful
SAREX contact in '92. In our application we pointed out that we had
already made one SAREX demonstration to the school, without a scheduled
contact. I've seen other schools try this before applying. (The attempt
was not successful -- we didn't even hear the shuttle, but that didn't
matter.)

We maximized the number of students exposed by setting up stations at
several schools, linking them together by repeater. The entire contact
was also broadcast on the local repeater, and monitored in a dozen more
schools, and countless offices.

And we promised a big publicity effort (my job). That was very successful,
with a live telecast on the local FOX affiliate, and two nights of
coverage on the news of the other market stations, plus lots of radio
news and newspaper coverage. I generated several press releases that I
faxed to the media, but it was the followup phone calls that got their
attention. Once they realized the potential of the story, they were
eager to cover it.

Our "earth" station was a good OSCAR-type satellite station, with 400
watts RF out to a circularly polarized, steerable antenna. The antenna
was important. The power was overkill. The 5-watt signal from the
shuttle was "pegging the needle" for most of the pass.

The first and last minutes of signal were distorted by doppler effect.
We were late in recognizing and compensating for that. Our contact
lasted 8 minutes... almost horizon-to-horizon. We had 4 kids, and each
got to ask at least 4 questions.

Before and after the contact, our "control station" on the repeater
described what we were doing, and what people could expect to hear.

I have a professionally produced videotape of both our "dry run" practice
exercise, and the contact itself. If you would like a copy, I'll make you

one for the cost of duplication and handling ($12). It will be a good way to see how it happens (at least here in Raleigh) and spur interest with club members in your area.

73, and good luck with your application (and contact!),

> WALL IN 5 TO 12 FT LENGTHS...
> I'M IN THE PROCESS OF REVAMPING THE MODE B AND S ANTENNA SYSTEM.

I have owned both KLM and M^2. KLM is a very good quality antenna. This past weekend I put up some M^2 antennas for Mode B. I think the materials are very good quality, but only time will tell about the durability of the machanical design. Also, I have an SWR problem, which I *THINK* is related to some inherited Belden 9913 and not the antennas. You can buy a Mode B antenna kit (including 2" fiberglass boom) from Radioware in Mass. Includes 2 M^2 circular pol antennas. One problem: The hardware used to mount the 435 MHz antenna includes a 1.5" U bolt, while the fiberglass mast is 2"! The mounting plate accomodates both 1.5 and 2". I just have to go out and buy a 2" U bolt now.

799. AEA 1232 problem

Newsgroup: rec.radio.amateur.space
Date: 1994-06-02 03:39:59 UTC
From: rdhoughton@vms4.sci.csupomona.edu
Message-ID: <1994Jun1.204000.1@clstcs>
Source record: 27460

I would be interested in hearing from anyone who has sucessfully
gotten the STEP and SCAN commands to work on an AEA DSP-1232
multi-mode controller. I am using a Yeasu FT-736R which expects
the up/dowm freq buttons to go high (+5V) when activated. The AEA unit
is designed to pull the up/down lines to ground. I have built a logic
inverter with a couple of resistors and NPN transistors but I still
can't get the doppler correction signals to work. It's difficult
to test the doppler correction except during a satellite pass. If I
am reading the manual correctly, the SCAN command should pulse the
freq control lines (that is if the SCAN command is implemented on the 1232
unit). By the way, I am using bver. 7.00 ROMs which are supposed to do
doppler correction.

Thanks in advance for any help...

Bob Houghton

>I was thinking about getting Cushcrafts AOP bundle oscar
>antennas. It seems like a good deal at $250. Can anyone give
>me some ideas about this? Thanks...

I started out with this setup, and I don't recomend it. The two
antennas don't point to the same boresight (patterns aren't
symmetric with the booms), and SWR rises significantly when they
are wet, even from heavy dew. I made a bunch of contacts using
this setup, but switching to KLM antennas made a world of difference.
I'm using the 22C and 40CX now, and am much happier.

Gary

To follow up what I said yesterday about M^2 antennas and my problem with SWR on my new Mode B setup:

> ... Also, I have an SWR problem, which I *THINK* is
> related to some inherited Belden 9913 and not the antennas...

It was, in fact, the cable. I replaced the feeds with brand new 9913 equivalent, and the SWR problem went away. Well, I did have to tweak the position of the shorting blocks on the 2m array for best SWR, but that was my assembly error, not the antenna.

In article <2sirer$gpv@pipeline.com>,
blaknite@pipeline.com (Noah Lehmann-Haupt) writes:
> I was thinking about getting Cushcrafts AOP bundle oscar
> antennas. It seems like a good deal at $250. Can anyone give
> me some ideas about this? Thanks...

Just my opinion...save your money and buy a better quality antenna
like KLM or M^2. I can almost guarantee you won't be happy with
the Cushcraft and end up buying something else anyway. The satellite
antennas are not their best product by any means, and besides so-so
performance, they may blow apart in the first good wind storm.

803. LUSAT-1 (LO-19): Actual status

Newsgroup: rec.radio.amateur.space
Date: 1994-06-02 21:09:28 UTC
From: lu7akc@asarin.ORG.AR
Message-ID: <gate.H3kBNc1w165w@asarin.org.ar>
Source record: 27456

```
Official LUSAT-1 Status Report

On june 1st 1994, during the 22739th orbit, the CW beacon was turned ON=
. This
operation was done by the control station (Norberto Pennini, LU8DYF) an=
d the
station encharged of the CW beacon (Rub=82n Ferreiro, LU6DYD).

Norberto (LU8DYF), turned OFF the "B" transmitter (437.125 MHz) and tur=
ned ON
the "A" transmitter (437.150 MHz). While this procedure took place, Rub=
=82n
captured some telemetry. When Norberto swapped the transmitters, Rub=82=
n started
to send the PN sequence, encharged to turn ON the CW beacon. After more=
than 9
months, the CW beacon was started again.

On june 2nd 1994, during the 22754th orbit, the CW beacon was turned OF=
F. This
operation was done by Norberto and Rub=82n.
Rub=82n turned OFF the CW beacon and Norberto swapped again the two tra=
nsmitters.
Once again, the CW beacon is OFF and the "B" Raised Cosine PSK transmit=
ter
(437.125 MHz) is ON.

We encourage those stations that have telemetry reports for this period=
to send
them to us for analisys purposes.

Overseas stations: If you capture any LUSAT-1 telemetry and send it in =
raw-mode
to the satellite control station, you'll receive a certificate for your
collaboration. These telemetry reports can be sent either via packet ra=
dio to
LU8DYF@LU8DYF.BA.ARG.SOAM and LU8DYF@ANY-ACTIVE-SATELLITE, or via Inter=
net to:
lu8dyf@asarin.org.ar

If you intend to use the satellite, please remember that the BBS is NOT=
LOADED
and it will NOT be operational for the next 2 weeks (approx.).

The LUSAT-1 recovery team want to thanks all the stations that sent LUS=
AT-1
```

telemetry data in RAW format.

The overseas stations that are going to receive the Special Award are:

1) Mr. Norimasa Okamoto (JN2LHU) from Gamagori city, Japan.
2) Mr. Bent Bagger (OZ6BL+OZ7SAT) from Denmark.

73's de Eduardo Sweet, LU7AKC (LUSAT-1 recovery team)

I used the HyGain Oscar-Link antennas. They seem pretty well constructed
and I made a bunch of contacts through AO-13 running my TenTec 2510 barefoot
(10 watts out).

810. What SAT's can I hear on a Scanner ?

Newsgroup: rec.radio.amateur.space
Date: 1994-06-03 15:35:02 UTC
From: gumbyrama@aol.com
Message-ID: <2snij6$7un@search01.news.aol.com>
Source record: 27459

I just rec'd my no-code Tech license and am very interested in the AMSAT's.
I use STS Plus tracking software and have been tracking the AO-21 bird and can hear it fairly well with a PRO 2006 and a RS Discone. I am becoming familiar with the procedures to operate with and am blown away by all this cool stuff.

I also have a shortwave with usb/lsb.

My main question is what other SAT's can i hear with my equipment now? I really would like to know what is out there before I choose my equipment

Thanks in Advance. Brad

811. Re: Orbital Elements for the Moon?

MOON
1 0002 93360.0000000 0.0000000 00000-0 00011
2 0002 22.4297 346.9573 .040813 180.3337 265.5319 0.035749304251

I can not vouch for the long-term accuracy of these keps, as I merely
pulled them off the local packet bbs. The two times I have plugged them
into to mactrak, it seem to work, ie the software predicted that the moon was
visible, and lo and behold, that great orb in the sky was actually there!

812. NAVSPASUR listeners?

Newsgroup: rec.radio.amateur.space
Date: 1994-06-03 19:13:41 UTC
From: thomsona@netcom.com
Message-ID: <thomsonaCqu5Et.5q6@netcom.com>
Source record: 27619

Over the past three or four years there has been occasional discussion in the Compuserve satellite watchers' group concerning reception of U.S. Navy space surveillance system (NAVSPASUR) VHF (ca. 219 MHZ) signals as they are reflected by satellites passing through the system's fan beams. The CW beams, radiated from the primary transmitter at Lake Kickapoo TX and two secondary sites in Arizona and Alabama, are narrow in the north-south direction and wide east-west. Satellites crossing a beam cause a "ping" which can be analyzed for angle-of-arrival and doppler to gain information about the satellite's orbital parameters. As the system is used by the Navy, several receiver sites are involved and the total amount of angle-of-arrival data (I don't think they use the doppler) is sufficient to determine the orbit completely. The most advanced of the Compuserve observers uses time-of-crossing, doppler, and coarse angle-of-arrival at a single site to partially determine the orbit, or to generate differential corrections to orbital elements previously determined.

The discussion on CIS has been useful to me since I'm doing a study of relatively cheap ways to do space surveillance, and I'd like to ask the wider world of the Net if anyone else is doing "unofficial" NAVSPASUR listening. If so, what kind of equipment and orbit determination algorithms are being used? Related techniques, such as use of the signals from powerful TV and FM radio stations, ATC radars, etc. would also be of interest.

813. LUSAT-1 (LO-19): Actual status

Newsgroup: rec.radio.amateur.space
Date: 1994-06-03 19:44:00 UTC
From: lu7akc@asarin.ORG.AR
Message-ID: <gate.2FqkNc1w165w@asarin.org.ar>
Source record: 27636

Official LUSAT-1 Status Report

Overseas stations: If you capture any LUSAT-1 telemetry and send it in raw-mode to the satellite control station, you'll receive a certificate for your collaboration. These telemetry reports can be sent either via packet radio to LU8DYF@LU8DYF.BA.ARG.SOAM and LU8DYF@ANY-ACTIVE-SATELLITE, or via Internet to: lu8dyf@asarin.org.ar

If you intend to use the satellite, please remember that the BBS is NOT LOADED and it will NOT be operational for the next 2 weeks (approx.).

The LUSAT-1 recovery team want to thanks all the stations that sent LUSAT-1 telemetry data in RAW format.

The overseas stations that are going to receive the Special Award are:

JN2LHU, OZ6BL, OZ7SAT, EA1BCU, EA2CLS, WH6I, W9ODI, SM5BVF, ZS6BMN, JJ1WTK, LU1FYZ, LU2FCY, LU2JCI, LU1JBR, LU8ENU, LU6DYD and LU1DBC.

73's de Eduardo Sweet, LU7AKC (LUSAT-1 recovery team)

e-mail: lu7akc@asarin.org.ar

814. Need NORAD elements !!!

Newsgroup: rec.radio.amateur.space
Date: 1994-06-03 21:32:41 UTC
From: lu7akc@asarin.ORG.AR
Message-ID: <gate.75LBNc1w165w@asarin.org.ar>
Source record: 27457

Hi!
I need the latest NORAD Keplerian elements and I don't know where I can get them. If you know where, please forward me that information. Also, if you have an "almost-new" NORAD set, please send it to me.

Thankyou in advance & 73's de Eduardo Sweet Biro (LUSAT-1 recovery team)

E-Mail: lu7akc@asarin.org.ar
Packet: lu7akc@lu7akc.#col.cf.arg.soam

815. Re: What SAT's can I hear on a Scanner ?

Newsgroup: rec.radio.amateur.space
Date: 1994-06-03 21:54:27 UTC
From: greg@core.rose.hp.com
Message-ID: <CquCur.n4D@icon.rose.hp.com>
Source record: 27620

Well, let's see...

AO-27 downlink is on 436.800, FM
RS-10 is on 29.360-400 USB
RS-12 is on 29.410-450 USB

The RS-10 & 12 beacons are 3khz down from the lower edge.

I doubt you'd be able to hear AO-13 or FO-20 (VHF/UHF + SSB + they're weak)

Enjoy!

Greg KD6KGW

816. Two-Line Orbital Element Sets (TLE406)

Newsgroup: rec.radio.amateur.space
Date: 1994-06-03 23:51:12 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.770687472@afit.af.mil>
Source record: 27618

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

817. Re: Oscar antennas?

Newsgroup: rec.radio.amateur.space
Date: 1994-06-04 15:12:20 UTC
From: mbutts@netcom.com
Message-ID: <mbuttsCqvowK.DDH@netcom.com>
Source record: 27617

blaknite@pipeline.com (Noah Lehmann-Haupt) writes:

>I was thinking about getting Cushcrafts AOP bundle oscar
>antennas. It seems like a good deal at $250. Can anyone give
>me some ideas about this? Thanks...

NO! They are garbage. I got that setup at first and was horrified at the poor quality of construction. Crimp-on PL-259s for one example. No way to get the elements straight for another. Two different spacings of the sections, comparing the manual with the crude markings on the boom pieces, which are held together with hose clamps. Cheezy gamma match. I didn't want to think about what those antennas would look like after a year of Oregon rain.

AES was kind enough to take them back and send me some KLMs instead (+ $$ of course :-). 14C/18C. Beautiful. Very well made. Teflon coax in the phasing lines. Good baluns matching folded dipoles. Excellent manual. I worked 66 countries on AO-13 in a year of casual operation with that setup.

OSCAR 13 is weak signal work. If I didn't have total confidence in my antennas I'd always wonder, is that signal I can't copy really that weak, or is it me...

DOVE SAYS "HI"

HR AMSAT NEWS SERVICE BULLETIN 155.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 4, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-155.01

DOVE-OSCAR-17 (DOVE) Voice Synthesizer Now Being Tested

The satellite is now speaking the phrase "HI, this is DOVE in space" for one minute of every four minutes. "HI" has been traditionally sent from Amateur satellites since OSCAR-1, so it seemed appropriate for this re-activation of the voice synthesizer in DO-17. The team will continue to work on improvements, including possibly raising the amplitude of the voice, which is presently about 1/2 that of the telemetry.

The speech software has been completely reloaded over the past 3 days. The S-band transmitter is presently turned off. Transmitter power will be optimized over the next few days while maintaining a positive power budget. Reception reports are welcome and please send them to PY2BJO. Telemetry is not needed at this time.

[The AMSAT News Service would like to thank Jim White (WD0E) for this bulletin item. Jim also wishes to acknowledge the other members of the DOVE Ground Command Team of WJ9F, VK7ZBX, N5AHD, NK6K with additional support from WB6LLO and K0RZ.]

OFFICIAL LO-19 STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 155.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 4, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-155.02

Official LUSAT-OSCAR-19 Status Report

On 01-JUN-1994, during orbit #22739, the CW beacon was turned back on. This operation was performed by the control station of Norberto Pennini (LU8DYF) and by the station in charge of the CW beacon, Ruben Ferreiro (LU6DYD).

At the same time, LU8DYF, turned OFF the "B" transmitter (437.125 MHz) and turned ON the "A" transmitter (437.150 MHz). While this procedure was

happening place, LU6DYD was capturing some telemetry. Then, when LU8DYF finally swapped the transmitters, and LU8DYD sent the necessary "pseudo-random" (PN) command sequence which subsequently turned on the CW beacon. After more than 9 months of being turned off, the CW beacon was started up again without any problems.

On 02-JUN-94, during orbit #22754, the CW beacon was turned OFF. This operation was again performed by LU8DYF and LU6DYD. LU6DYD turned OFF the CW beacon and LU8DYF agained swapped the two transmitters to be sure they were both working properly. At the present time, the CW beacon is presently OFF and the "B" Raised Cosine PSK transmitter (437.125 MHz) is now ON.

The LUSAT-1 Recovery Team encourages those stations that have collected telemetry reports during this period to send them to LU8DYF for analyses purposes.

Overseas stations: If you capture any LUSAT-1 telemetry and send the "raw" satellite telemetry to the satellite control station, you will receive a certificate for your help. These telemetry reports can be sent either via packet radio to LU8DYF@LU8DYF.BA.ARG.SOAM and LU8DYF@ANY-ACTIVE-SATELLITE, or via Internet to: lu8dyf@asarin.org.ar

If you intend to use the satellite, please remember that the BBS is NOT LOADED and it will NOT be operational for the next 2 weeks (approx.).

The LUSAT-1 recovery team want to thanks all the stations that sent LUSAT-1 telemetry data in RAW format.

The overseas stations that are will receive the Special Award are:

1) Mr. Norimasa Okamoto (JN2LHU) from Gamagori, Japan.
2) Mr. Bent Bagger (OZ6BL+OZ7SAT) from Denmark.

73's de Eduardo Sweet, LU7AKC (LUSAT-1 recovery team)

[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]

LO-19: LO-19 is on the air but only telemetry is being sent and there are
are no BBS functions operational. Expect a few more weeks before
the BBS returns. [WH6I]

KO-23: This bird and KO-25 are very busy at the present time with message
and file traffic. Also, the program WISP can also be found on the
BBS. WH6I also notes that there are alot of earth image files
on the BBS. [WH6I]

AO-16: AO-16 is running strong, the only 1200 baud bird in operation at the
present time. WH6I is uploading the WISP program to AO-16 for
users to test out. [WH6I]

IO-26: IO-26 has not been heard from for awhile. [WH6I]

MIR: For all who have made a contact with MIR and would like to receive a
QSL card, send your QSLs to the following address:
RV3DR-Serge Samburov, Space "MIR" QSL Manager
Chief of Cosmonaut Amateur Radio Department NPO "Energia"
P.O. BOX 73, Kaliningrad-10 city, Moscow Area, 141070, RUSSIA.
RV3DR's packet radio address is as follows: RV3DR@R0MIR-1 or
RV3DR@RK3KP.#MSK.RUS.EU

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly
OSCAR status reports. If you have a favorite OSCAR which you work on a
regular basis and would like to contribute to this bulletin, please send
your observations to WD0HHU at his CompuServe address of 70524,2272, on
INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO
area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current
set of orbital elements are not generating the correct AOS/LOS times at
your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you
provide will be of value to all OSCAR enthusiasts.

Call For Papers For The AMSAT-NA Space Symposium & Annual Meeting

The 1994 AMSAT-NA Annual Meeting and Space Symposium is to be held Oct. 7-9, in Orlando, FL. This is a call for papers and presentors. Come help us celebrate 25 years of AMSAT in Space. Share your experience with the amateur satellite community. We need your help to be a success. Editing, formatting, graphics and even typing can be provided. Even if you cannot attend, please consider a paper for publication.

Topics for all amateur satellite disciplines are sought. The following is the schedule for receiving papers for the Symposium:

Author and Title requested ASAP.
Compose a short abstract by July 1.
Final drafts are requested on or about August 26.

Direct your inputs and inquiries to:

Steve Park (WB9OEP)
12122 99th Ave. N.
Seminole, FL 34642
Phone: (813) 391-7515
Internet: SKPA@QMGATE.ECI-ESYST.COM
Pkt Radio: WB9OEP @ W4DPH

Join us in Orlando, FL for the fun and festivities. For more information about the Symposium, contact AMSAT-NA Headquarters at (301) 589-6062.

K9PVW BECOMES A SILENT KEY

HR AMSAT NEWS SERVICE BULLETIN 148.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 28, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-148.02

KARL O. "K. O." LEARNER II, K9PVW, SK

An old friend to many in the amateur satellite world and long-time AMSAT member, "K.O." LEARNER II (K9PVW) became a Silent Key (SK) recently. "K.O" died on 16-May-94 at his home in Kokomo, Indiana. He was 49. For many years, "K.O." organized the AMSAT booth and programs at Dayton, worked tirelessly as an AMSAT area coordinator, and ran a local AMSAT Net. Also, many will remember him as the Net Control Station for what is today known as the "OPS Nets" in the early days of AO-13. "K.O." worked as an engineer for Delco Electronics in Kokomo. AMSAT-NA Headquarters wishes to express its condolences to "K.O's" family and friends and will remember him as a patient "ELMER" to many beginners trying to make their first contacts on the OSCARS.

[The AMSAT News Service (ANS) would like to thank Martha Saragovitz of AMSAT-NA Heaquarters for this bulletin item.]

DOVE STATUS

HR AMSAT NEWS SERVICE BULLETIN 148.03 FROM AMSAT HQ
SILVER SPRING, MD MAY 28, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-148.03

DOVE-OSCAR-17 (DO-17) Status Report

On 25-MAY-94 at 05:25 UTC the DOVE Ground Command Team started loading and executing test software designed to assure the operation of the voice module after several months of dormancy. A brief test of the voice capability generated only garbled voice, so it was turned off. The Team is now investigating possible causes, and at this point believe it is a software problem, not hardware.

For the next few days DOVE may be in various modes as the Team continues testing and/or loading new software. The S-band transmitter will remain off. Telemetry reports are not needed at this time.

[The AMSAT News Service (ANS) would like to thank Jim White (WD0E) for submitting this bulletin item. WD0E can be reached at his INTERNET address of wd0e@amsat.org.]

WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 148.05 FROM AMSAT HQ
SILVER SPRING, MD MAY 28, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-148.05

Weekly OSCAR Status Reports: 28-MAY-94

AO-13: Current Transponder Operating Schedule:
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 May 07-Jul 11
Mode-B : MA 0 to MA 170 |
Mode-BS : MA 170 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Alon/Alat 230/-5
Mode-B : MA 250 to MA 256 |
Omnis : MA 250 to MA 120 | Move to attitude 180/0, Jul 11
[G3RUH/DB2OS/VK5AGR]

FO-20: The analog mode will be continued indefinitely.
[Kazu Sakamoto (JJ1WTK) qga02014@niftyserve.or.jp]
`

KO-25: Please note that the KO-25 uplink was switched back to 145.980 MHz. The downlink is 436.500 MHz. [K6OYY]

AO-16: AO-16 is chugging along, the only 1200 baud BBS bird running. [WH6I]

LO-19: LO-19 is undergoing re-uploading of software. The ground controllers state that it will not be available for general use for about a month. [WH6I]

IO-26: IO-26 is also in the software uploading process. Apparently both birds, i.e., LO-19 & IO-26, suffered SEUs at about the same time. [WH6I]

MIR: MIR'S BBS is up and running. It seems that whatever electrical power problems they were experiencing aboard MIR have now been sorted out. ZR5JRS has worked the MIR BBS on a number of occassions over the last week with only a few problems. The only problem he has experienced is with users down-range that do not send the disconnect command before MIR goes LOS at their QTH. If a several users forget to send the disconnect, ZR5JRS find that nobody can not get in since the BBS has not yet given a time out. Please don't forget to send a disconnect command before MIR goes "over-the-horizon" at your QTH. [ZR5JRS @ ZS0HFS.NTL.ZAF.AF]

RS-10\11: This satellite, as usual, is working extremely well and ZR5JRS has made many contacts throughout Southern Africa with good 599 signals. ZR5JRS notes that it is very pleasant to see a small but revived interest in RS-10 in South Africa. He hopes that it will last. [ZR5JRS @ ZS0HFS.NTL.ZAF.AF]

KO-23: Some new earth images are now showing up on KO-23's BBS. WH6I notes that so far none of the images he has looked are very spectacular. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

MONDAY JUNE 6, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is
published every week and is made available for unlimited distribution.

* DOVE SPEAKS *
===============
It has been said that good things come to those who wait, and this week it
is a pleasure to report that DOVE-OSCAR-17 is uttering its first words!
Congratulations to Jim White, WD0E, and the other spacecraft controllers
for their fine effort in bringing this injured satellite back to life.

* MIR INFORMATION *
===================
Sven Grahn of Sollentuna, Sweden provided the following information
regarding the frequencies and emissions used by the Mir space station.

Sven reports the signals on 166 MHz are PCM FM signals and the modulation
index is so high that two peaks appear in the signal spectrum, one on
each side of the carrier. The carrier is on 166.000 MHz creating a signal
peak at 166.150 MHz and another peak at 165.850 MHz.

The signals from Soyuz and Progress on 922.75 MHz contain a carrier plus
telemetry sidebands. The modulation type is unknown. Sometimes tones
are frequency modulated on the carrier. These contain sixteen-bit words,
which probably constitute a command verification link. There is a similar
link from Soyuz and Progress on 926.07 MHz operating simultaneously with
the 922.75 MHz link.

For Progress and Soyuz, the 922, 926 and 166 MHz signals are switched on
simultaneously by ground command.

[Info via Sven Grahn]

* UNAMSAT-1 NEWS *
==================
The launch campaign for the UNAMSAT-1 MicroSat is currently underway with
launch set for 15th June, but there is a possibility that it might be

delayed about one week. The launch will be on a refurbished Soviet SS-18 ICBM designed to carry satellites. The final Keplerian elements of the intended orbit are not known, but the known parameters are as follows:

Orbital Inclination = 73 degrees
Altitude = 730 KM
Orbital Eccentricity = 0.00000000

The satellite will separate from the rocket with no spin. All transmitters will be silent at separation and for a period of at least 1 hour. The VHF receive antenna and the two halves of the canted dipole for 40.997 MHz will be collapsed and then they will be deployed 3 minutes after separation.

The following information was first published in mid-1992, but may have changed since:

As with the earlier MICROSATs, UNAMSAT-1 it has five modules, each about 20 cm on a side. Four of the five modules are updated clones of existing MicroSat hardware/software carrying Dual 70cm PSK transmitters; a computer and power system; a 5-channel 2M FSK receiver and running similar software to the other MICROSATs. The main differences from the earlier MicroSat configuration are that the computer will have 4 MB of RAM instead of 8 MB and UNAMSAT-1 will be equipped with Gallium Arsenide solar panels.

The innovative new addition is a brand new on-board experiment in the 5th "TSFR" ("This Space For Rent") module:

UNAMSAT-1's primary mission is to act as meteor sounder. It will contain a 40.097 MHz transmitter with 60 watts output during pulses from which can be varied from 1 to 10 msec in duration and with a pulse repetition rate of 1 to 10 seconds, as controlled by a computer subsystem. The meteor echoes will be detected on a receiver at the same frequency designed to detect the returned echo and measure its doppler shift. The use of the meteor sounder is to obtain research data on the full-sky spatial and velocity distribution of meteors, with the focus on a search for high-velocity meteors originating outside our solar system.

The 40 MHz frequency for this transmitter is in accordance with the ITU frequency allocations table for scientific research and both the 40 MHz and amateur frequencies have been licensed by Mexican authorities.

The meteor receiver is an SSB "zero-IF" design and the return echoes are digitized and stored in the normal computer's RAM. After each pulse, the spectrum of the received signal will be determined using the onboard computer as a DSP Fourier Transform spectrum analyzer. If a meteor echo is detected, the echo will be saved for later transmission as a special telemetry frame.

The 1-10 second repetition rate for the meteor transmitter will be adjusted depending on the state of charge of the batteries and other spacecraft power requirements, and also on the time domain requirements of the echoes.

When UNAMSAT-1 is not involved in meteor research, it can be turned into a standard PACSAT message store-and-forward satellite and data will be sent using standard amateur AX.25 packet but the actual frequencies haven't been determined yet.

[Info via Richard, G3RWL @ GB7HSN.#32.GBR.EU]

* LUSAT-1 NEWS *
==========
The following packet frame was received from LUSAT-1 on 29-May-94 by KD2BD in New Jersey at 16:11 UTC:

LUSAT-1>AMARG [29-05-94 16:11:21] <UI>:

May 21.

OBC crashed on May 17 at +/- 2:45 utc, lat 45s, lon 43 w.
Only digipeater is available.

LU8DYF, LO-19 command station.

Raw telemetry should be directed to Noberto, LU8DYF either via packet radio at LU8DYF@LU8DYF.BA.ARG.SOAM, via the Internet at lu8dyf@asarin.org.ar, or via any active Pacsat by directing the message to LU8DYF. Special awards are available to those who submit telemetry reports.

* REPORT FROM HI8 *
==========
Bill Meara, N2CQR/HI8 in Santo Domingo in the Dominican Republic sent a FAX to let everyone know that there is a small but enthusiastic group of satellite operators in his country. Pericles, HI8P, a lifetime member of AMSAT, and others have recently been bit by the RS satellite bug. They also listen for DOVE, connect to Mir, and work the SAREX experiments when flown on the US Space Shuttles.

Bill reports that RS-10 and RS-12 are performing well, and that QSLs for ROBOT contacts are available through DF4XW. Bill uses an old Hallicrafters HT-37 transmitter and Drake 2-B receiver with dipole antennas to work RS-12 Mode K. His station is just another example of a low-cost, low-frills station that can be used to make satellite contacts.

* FO-20 NEWS *
==========
On 19-May-94, the FO-20 command station announced that a problem exists in FO-20's onboard computer system. The satellite's transponder will remain in the analog mode (JA) until further notice.

ARLS023 AMSAT call for papers

AMSAT call for papers

The 1994 AMSAT-NA Annual Meeting and Space Symposium will be held October 7 to 9, in Orlando, Florida. AMSAT seeks papers for the symposium and can provide authors with help in editing and graphics, if needed. Papers are welcome even if the author is unable to attend the symposium.

Topics for all amateur satellite disciplines are sought, including introductory tutorials, satellite operations, Phase IIID design and development, and new applications and techniques.

Sign up now and request an author's kit, then compose a short abstract by July 1. Final drafts are requested on or about August 26.

Direct inquiries to Steve Park, WB9OEP, 12122 99th Ave North, Seminole, FL 34642. Tel (813) 391-7515.

828. Quadrifilar helix ?

Newsgroup: rec.radio.amateur.space
Date: 1994-06-07 21:11:38 UTC
From: bmm1@freenet.scri.fsu.edu
Message-ID: <199406072101.AB18944@freenet3.scri.fsu.edu>
Source record: 27630

I read Dave Guimont's article on quadrifilar helix antennas in the March/april Amsat journal. I would appreciate any info from anyone who has any additional info on these antennas. Specifically does anyone have an answer to these questions:

Which polarity is best for the 9600 FM sats?
Where can one get the copper hard line Dave refers to?
Can these antennas be purchased and from who?
I have the first addition of the Satellite Experimenters Handbook. Does the second edition have more info on these antennas?
Will the Q.H. receive below 20 degrees elevaation. I am using verticle colinear antennas with 6 to 9 dB gain in the horizontal plane. They pick up some data on any pass above about 5 degrees but perform very poorly on direct passes over about 40 degrees. Would anyone like to comment on weather an antenna pointing up (like the Q.H.)would copy more or less data if it can not see low elevation passes.

Thanks for any info!

: I just rec'd my no-code Tech license and am very interested in the
: AMSAT's.
: I use STS Plus tracking software and have been tracking the AO-21
: bird and can hear it fairly well with a PRO 2006 and a RS Discone. I
: am becoming familiar with the procedures to operate with and am blown
: away by all this cool stuff.

: I also have a shortwave with usb/lsb.

: My main question is what other SAT's can i hear with my equipment
: now? I really would like to know what is out there before I choose
: my equipment

: Thanks in Advance. Brad

I have used a PRO-2006 to monitor all the low earth orbit Oscars and
weather sats. A mast mounted preamp is necessary for the 70cm
downlinks. The PRO-2006 is my *only* dowlink radio. I have made
several mods to it which allow me to demodulate 1200 psk and 9600 fsk.
It can be made to do automatic doppler compensation on the 9600 baud
sats. I have worked oscars 16,18,19,22,23&25 with it and have been
quite pleased. If you get to the point that you want more technical
details just let me know.

833. RV3DR MIR QSL PATH?

Newsgroup: rec.radio.amateur.space
Date: 1994-06-08 03:32:40 UTC
From: mpickard@netcom.com
Message-ID: <mpickardCr276p.Iq0@netcom.com>
Source record: 27635

Recently I worked MIR on packet and in the header from MIR they gave RV3DR as the QSL Manager however I couldn't find RV3DR in the 94 Callbook. Does anyone know RV3DR's address?

Thanks very much. This was my first space QSO and was extra special because my family was able to go outside and visually sight it as it passed over the Seattle area!

73,
Mike K7NPN
mpickard@netcom.com

834. Sats you can hear on a scanner

Newsgroup: rec.radio.amateur.space
Date: 1994-06-08 08:38:17 UTC
From: dt650@cleveland.Freenet.Edu
Message-ID: <2t401p$q5b@usenet.INS.CWRU.Edu>
Source record: 27637

Here's my list of satellites that can be heard on a scanner:

Space Shuttle (when up) 145.55 voice
Mir 145.55 voice and packet
OSCAR-21 145.987 (use 145.985 or .990) voice,
packet, wefax
Dove 145.825 Packet and now voice too
AO-27 436.800 Voice. Weak! Use a six element
uhf beam ($50.00, can be hand-
held) Only operates in daylight
and usually only on weekends

Short Wave Radio Birds:
RS-10/11 29.360-29.400 SSB/CW CW Beacon: 29.357
RS-12/13 29.410-29.450 SSB/CW CW Beacon: 29.407

If you have accesss to packet, I put pass times for these birds
out weekly. Look for articles addressed to EZSATS.

Dave, N9LTD

I have a friend in New Zealand and I was wondering about corresponding through Mir. Is it like any other PBBS or does it have any special command sets. How long is an ordinary pass? Also, does anybody know of any good Macintosh tracking programs? I am in the process of ordering a AR-2 2M vertical, is this good for Mir? I have worked RS-10/11 and RS-12/13 And was figuring why stop there? TNX in advance. DE N0UJT A.K.A. ANAYLOR@DELPHI.COM

838. Jupiter Decametric Emissions

Newsgroup: rec.radio.amateur.space
Date: 1994-06-09 15:12:20 UTC
From: (unknown)
Message-ID: <1994Jun9.151220.19158@news2.den.mmc.com>
Source record: 27642

I will be monitoring the decametric frequencies during the upcoming Jupiter/SL9 encounter. I am looking for some more detail on the theory behind the emission sources. According to current predictions, there will be approximately a 3 hour delay between a fragment collision and the reception of any signals on Earth. Is the light time to Jupiter accounted for in this prediction? I'm also monitoring the usual decametric radio emissions (with some success) prior to the event. If a storm occurs and Jupiter sets at my location - shouldn't I be able to detect the storms if they occured prior to the setting time? Are the storms localized to a specific location on the planet?

Are the storms strong enough to penetrate the ionosphere with an MUF above my frequency or is this just impossible. Any help (replies, FTP sources) would be helpful.

Check out the article on this subject by Geoff Grayer G3NAQ in the June 1994 issue of "Radio Communication", the journal of the Radio Society of Great Britain. Geoff is also asking for logs and recordings of the activity for the RSGB Propogation Studies Committee.
You might also look at the newsgroup sci.astro.

George Pickburn (gap@pickburn.demon.co.uk) wrote:

: Can anyone point me to an FTP source (or Gopher or whatever) for a satellite
: ephemeris prediction program for a Mac so that I can use the Keplerian elements
: I see on the Net?

: Thanks in anticipation,

: George Pickburn, G3XJK

There is a Mac satellite tracker available from Amsat at a reasonable
cost. The procedes from the sale of the software helps ensure that
there are satellites to track! I thing all the really good software
has been donated to the cause.

Bruce.

846. Two-Line Orbital Element Sets (TLE411)

Newsgroup: rec.radio.amateur.space
Date: 1994-06-10 19:03:38 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.771275018@afit.af.mil>
Source record: 27649

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

847. Online Space Station Petition

Newsgroup: rec.radio.amateur.space
Date: 1994-06-10 23:31:17 UTC
From: ssa@SEDS.LPL.Arizona.EDU
Message-ID: <2tat45$qfc@news.CCIT.Arizona.EDU>
Source record: 27651

Dear Colleague:

Student Space Action would like to inform you of a way in which you can directly voice your support for manned space exploration. As you read this, your space program is in danger of becoming extinct. Congress is once again attempting to eliminate space station funding. Cancellation of the space station could mean the phase-out of space exploration and eventual termination of aerospace industries and job opportunities. The resulting impact on the nation's economy, technology and educational system would be disastrous.

You can tell your congressmen exactly how much you support the space station and the manned space initiative by signing the Student Space Action's Interactive Online Petition. Simply follow these steps:

telnet seds.lpl.arizona.edu
login> space

Now answer the questions to the best of your ability
(read the directions accompanying the petition--
use <tab> to enter answer; <enter> to toggle yes/no;
up/down arrows to go backwards and forwards through
questions. Caution: if floating characters appear on
your screen--ignore--it's probably just an emulation
problem. Your petition will still be signed.

After you submit the petition, you will receive information
on your congressmen and senators so you can contact them further
by phone or mail if you desire.

The petition is also accessible by NCSA Mosaic. Simply go to the following
URL and follow the directions:

URL: http://seds.lpl.arizona.edu/ssa/petition.html

Answer the questions and submit the petition and you
will receive the same information as the telnet version.
You will also have the option of linking to the space
station home page where you can read up-to-date information
on the space station, including issues of "Space Station
This Week."

Please forward this message to anyone you may feel would want to be a part
of this effort--everyone!

If you believe the space program is a vital part of our country's future,
both in economic growth and technological advancement, then sign the

Student Space Action's Interactive Petition.

If you believe that NASA should remain as an engine for continued manned space exploration, then tell everyone you know to sign this petition.

If you believe that our government, by supporting an initiative like the space station, is making an investment in the future generation of this great nation, then send your message to Washington by signing the Student Space Action Interactive Petition.

SPACE STATION: IT'S ABOUT LIFE ON EARTH!!

Your voice does count! And it WILL make a difference!

Sincerely,

Student Space Action
ssa@seds.lpl.arizona.edu

848. Sat reception

Newsgroup: rec.radio.amateur.space
Date: 1994-06-11 00:46:05 UTC
From: wa4ymz@aol.com
Message-ID: <2tb1gd$89q@search01.news.aol.com>
Source record: 27652

A few days ago I read a posting from someone who had modified a scanner, a PRO-2006 I believe, for satellite reception, with the offer to post or send the details. I'm interested in hearing what can be done with this mod, especially if packet can be recieved. I have a Paccomm PSK-1 Satellite Modem being driven by an older MFJ -1270 TNC. If this can be wired into the scanner and work, I'd certainly like to give it a try. On a slightly different note, I'd be interested in finding mods to the Uniden 2600 for expanded coverage (26-30MHz) or info on modifying a old TS-670 with the general coverage option to do the same. Anyone had any luck with either of these? If so, I'd be interested in if either can be used to drive a transverter and how it has been done. Please respond to WA4YMZ@AOL.COM or, preferrably, Gary Rogers@DGC.ceo.dg.com. Tnx in advance. Gary WA4YMZ
P.S. ftp info on either of these would be great!

849. looking for 2m all mode for sat work

Newsgroup: rec.radio.amateur.space

Recently I have become active on 144Mhz EME. One of the bottlenecks surounding EME is the passing of skeds made on 14.345 Weekend Mornings from the US to EU and other continents. I wonder if anyone wants to try and improve the situation using the Internet? I will respond to all msgs. Thanks de Tim, NC7K in DM09ep, Reno, NV... sk

You might also post this on the vhf listserver. Send e-mail
to vhf@w6yx.stanford.edu with the one line
subscribe vhf
to become a subscriber.
I get 3-6 mails a day from it containing such things as vhf
dxpeditions , scores in contests, who is on and where, what DX popped
up last night etc.
I haven't seen anyone arrange EME skeds there although they are
arranging every other sort of sked there.

SB SAT @ AMSAT $ANS-162.01
DOVE VOICE TESTING STATUS

HR AMSAT NEWS SERVICE BULLETIN 162.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 11, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-162.01

DOVE-OSCAR-17 (DOVE) Voice Synthesizer Testing Continues

At about 11-JUNE-94 05:30 UTC the DOVE Ground Command Team completed a reload of the DOVE software and activated another voice test. The pronunciation of the word "Hi" is a bit different and the overall amplitude of the voice is higher. The text message is a greeting to those attending the ARRL Convention and Education Forum.

The DOVE Ground Command Team expects to continue the hardware testing process while simultaneously proceeding with software development. It is expected that this effort will probably last several days to a few weeks before all the testing and software developement is completed. There may be times when the voice message will not be heard due to uploading of new software.

It would be appreciate if reports on how well the voice can be heard with simple receiving equipment (a H/T with a rubber duck antenna) could be sent to any of the following individuals who have mail address on INTERNET:

WJ9F@amsat.org
PY2BJO@amsat.org
WD0E@amsat.org
VK7ZBX@amsat.org
N5AHD@amsat.org

Telemetry is not needed at this time.

[The AMSAT News Service would like to thank Jim White (WD0E) for this bulletin item.]

SB SAT @ AMSAT $ANS-162.03
WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 162.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 11, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-162.03

Weekly OSCAR Status Reports: 11-JUN-94

AO-13: Current Transponder Operating Schedule:
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 May 07-Jul 11
Mode-B : MA 0 to MA 170 |
Mode-BS : MA 170 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Alon/Alat 230/-5
Mode-B : MA 250 to MA 256 |
Omnis : MA 250 to MA 120 | Move to attitude 180/0, Jul 11
[G3RUH/DB2OS/VK5AGR]

LO-19: LO-19 is on the air but only telemetry is being sent and there are are no BBS functions operational. [WH6I]

KO-23: This bird and KO-25 are very busy at the present time with message and file traffic. There have been a lot of new earth imaging files available for down loading on both birds. The file KAIW008D gives a good image of the Italian penninsula in the Med. There is also a steady stream of WISP files as ZL2TPO keeps the his programing modifications coming. Also, the program WISP can also be found on the BBS. [WH6I]

AO-16: AO-16 is running strong, the only 1200 baud bird in operation at the present time. [WH6I]

IO-26: IO-26 is sending telemtry, but the BBS is not yet on. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO

area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

InterNet is still in use for skeds. Klaus, DL4EBY is making skeds
for europe on 14.345 (via our clubstation DK0TU). We are reachable
via Internet as 'afutub.extern.tu-berlin.de' [130.149.130.138].
You may write a message via e-mail to 'klaus@afutub.extern.tu-berlin.de'
for further information about EME skeds and the EME-net.

Regards/73, Pat, DL7AUC, for DK0TU, root@afutub.extern.tu-berlin.de

856. AZ/EL Rotator FOR SALE

Newsgroup: rec.radio.amateur.space
Date: 1994-06-13 12:10:34 UTC
From: debaker@bnr.ca
Message-ID: <2thibq$ngk@crchh7b0.bnr.ca>
Source record: 27658
Cross-posted to: rec.radio.amateur.swap,rec.radio.amateur.space,rec.radio.amateur.antenna

Hello,

I have a like new Az/El rotator for sale. It is designed for light duty vhf/uhf antennas, such as an Oscar setup. Comes ready to mount on a 1.5 inch (max) vertical mast and will accept up to a 1.5 inch horizontal mast such as the fiberglass unit from KLM. Comes with a control head for each rotor, and can be easily connected to a computer for automatic control (with minor modifications).

These units are capable of carrying a fair load. I have had no problems turning a pair of KLM's (2M-14C/435-18C), even without balancing them. Rotation time is about 60 seconds AZ, 30 seconds EL (180 degrees). These units have never been outdoors either...only used inside.

I am offering two 75 foot lengths of new 5 conductor wire FREE with the package. Also, the unit can be controlled using a single 8 conductor rotor wire if desired.

I am asking $175 + shipping.

Please email to debaker@bnr.ca
or call, 214-684-7351 (day)
73,

+---+

857. Satellite Tracking Hardware

Newsgroup: rec.radio.amateur.space
Date: 1994-06-13 15:17:08 UTC
From: ken@fstop.csc.ti.com
Message-ID: <940613151708@kendurham.sc.ti.com>
Source record: 27564

Dialing WWV to calibrate the PC system clock has shown that the error is too large to be able to track the low earth orbiting satellites without calibrating several times a week. This could get expensive since the call is long distance.

Does anyone know of a plug-in board intended to take over the clock's time function with greater accuracy?

The computer clock problem seems to be a common one (from comments heard on AO-13.) Any info on the subject would help.

Ken Durham K5MBV

SB NEWS @ AMSAT $SPC0613
* SpaceNews 13-Jun-94 *

BID: $SPC0613

=========
SpaceNews
=========

MONDAY JUNE 13, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* DOVE STATUS *
===============
Jim White, WD0E, reports that DOVE's voice synthesizer is undergoing tests. The satellite is now speaking the phrase "HI, this is DOVE in space" for one minute of every four minutes. "HI" has been traditionally sent from Amateur satellites since OSCAR 1, so it seemed appropriate for this re-activation of the voice synthesizer in DO-17. The team will continue to work on improvements, including possibly raising the amplitude of the voice, which is presently about half that of the telemetry.

Software was completely reloaded last week. The S-band beacon has been turned off. Transmitter power will be optimized while maintaining a positive power budget. Reception reports are welcome (to PY2BJO). Telemetry is not needed.

Jim White
WD0E for the team: WJ9F, VK7ZBX, N5AHD, NK6K
With support from WB6LLO and K0RZ

* LUSAT STATUS *
================
LUSAT-OSCAR-19 is still not available for general use, and the BBS is not expected to be operational for the next few weeks. Raw telemetry should be sent by packet radio to LU8DYF@LU8DYF.BA.ARG.SOAM or LU8DYF@ANY-ACTIVE-SATELLITE, or via the Internet to: lu8dyf@asarin.org.ar. Certificates are available for those who forward telemetry reports.

The LUSAT-1 recovery team wants to thank all stations who sent LUSAT-1 telemetry data in RAW format, including:

JN2LHU, OZ6BL, OZ7SAT, EA1BCU, EA2CLS, WH6I, W9ODI, SM5BVF, ZS6BMN, JJ1WTK, LU1FYZ, LU2FCY, LU2JCI, LU1JBR, LU8ENU, LU6DYD and LU1DBC.

[Info via Eduardo Sweet, LU7AKC (LUSAT-1 recovery team)]

* ITAMSAT (IO-26) BACK ON *
==========
After a couple of weeks of stand-by mode, ITAMSAT under ground command was switched back ON. A new MBL code was successfully loaded to test the modified s/c configuration (secondary TX on). Telemetry shows all the vital parameters in nominal status. Further tests will be carried out in the next few days. Also due to the very limited time budget of the command stations, please expect a few weeks before normal operations.

[Info via Alberto, I2KBD, of the ITAMSAT Command Team]

* APT STATUS *
==========
Observed at 50.7 NLat, 7.1 ELon (Germany) on 28-May-94:

NOAA-9: APT 137.62 MHz On
NOAA-10: APT 137.50 MHz *OFF*
NOAA-11: APT 137.62 MHz On
NOAA-12: APT 137.50 MHz On
Meteor 2-21: APT 137.85 MHz On
Meteor 3-5: APT 137.85 MHz *OFF*

The VHF-conflict between NOAA-10 and NOAA-12 continues with NOAA-10's APT turned off. Meteor 3-5 APT is off too. The APT-frequency of Meteor 2-21 changed from 137.40 MHz to 137.85 MHz, but the signal is weak as always. As Meteor 3-5 is off, old NOAA-9 now is the best source for good vis-images.

[Info via Peter Henne]

* FO-20 NEWS *
==========
On 19-May-94, the FO-20 command station announced that a problem exists in FO-20's onboard computer system. The satellite's transponder will remain in the analog mode (JA) until further notice.

[Info via Kazu Sakamoto, JJ1WTK]

* DISTRIBUTION INFORMATION *
==========
Recent FCC rule changes have made both the originator of packet radio bulletins as well as the control operator of the originating BBS legally responsible for the content of packet radio bulletins. As a result, many bulletins entering the Amateur Packet Radio Network (AMPR) must be held for review by the BBS sysop before forwarding can begin. The adoption of this new procedure will lead to delays in the distribution of SpaceNews and other bulletins within the Amateur Packet Radio Network.

In addition, recent routing changes have lead to local Internet mail problems. This is expected to produce distribution delays within the packet network since the Internet is used as a SpaceNews distribution backbone.

* THANKS! *
==========
Thanks to all those who sent messages of appreciation to SpaceNews,
especially:

KB3AMR KB3MF VK4ZDR

...and Flavio Cimardi at IBM Microelectronics in Italy.

* FEEDBACK/INPUT WELCOMED *
==========

No. DO NOT SEND SUBSCRIPTION REQUESTS TO VHF@W6YX.STANFORD.EDU! That's the mailing list address, not the subscription request address (which by convention is vhf-request@w6yx.stanford.edu). We've just gotten dozens of misdirected requests as a result of this posting...

Sorry to post here but mail to your address bounced.

Try a shareware package - Rightime and Settime. This package does two
things very well in my initial try-out:

1. Settime: sets computer clock automatically via connection to US
Naval Observatory.

2. Rightime: Keeps computer clock (DOS AND CMOS) to within 0.1 seconds
over time after system is set (takes 3 - 6 time sets or
calls - I used WWV twice over 24 hours and then Settime
twice. Over 2 weeks the program did an excellant job.

One caveat - rightime uses the serial interrupts in doing its job so get
the most recent version as there are switches in the program to sense when
serial ports are used and it stops using the interrupts. Over the time I
tried it - the program worked very well and I have had only a few overruns
in DOS at 19.200 operating KO-23 or KO-25. Will try WISP later and
I suspect the buffers and 16550s will eliminate overruns.

THe two programs are avilable at Air Systems Technologies BBS:

(214) 869-2780

they are listed as:

Tset.... .zip
ritm.... .zip

Subject: Online Space Station Petition
To: ham-space@ucsd.edu

Dear Colleague:

Student Space Action would like to inform you of a way in which you can directly voice your support for manned space exploration. As you read this, your space program is in danger of becoming extinct. Congress is once again attempting to eliminate space station funding. Cancellation of the space station could mean the phase-out of space exploration and eventual termination of aerospace industries and job opportunities. The resulting impact on the nation's economy, technology and educational system would be disastrous.

You can tell your congressmen exactly how much you support the space station and the manned space initiative by signing the Student Space Action's Interactive Online Petition. Simply follow these steps:

telnet seds.lpl.arizona.edu
login> space

Now answer the questions to the best of your ability
(read the directions accompanying the petition--
use <tab> to enter answer; <enter> to toggle yes/no;
up/down arrows to go backwards and forwards through
questions. Caution: if floating characters appear on
your screen--ignore--it's probably just an emulation
problem. Your petition will still be signed.

After you submit the petition, you will receive information
on your congressmen and senators so you can contact them further
by phone or mail if you desire.

The petition is also accessible by NCSA Mosaic. Simply go to the following URL and follow the directions:

URL: http://seds.lpl.arizona.edu/ssa/petition.html

Answer the questions and submit the petition and you
will receive the same information as the telnet version.
You will also have the option of linking to the space
station home page where you can read up-to-date information
on the space station, including issues of "Space Station
This Week."

Please forward this message to anyone you may feel would want to be a part of this effort--everyone!

If you believe the space program is a vital part of our country's future, both in economic growth and technological advancement, then sign the Student Space Action's Interactive Petition.

If you believe that NASA should remain as an engine for continued manned space exploration, then tell everyone you know to sign this petition.

If you believe that our government, by supporting an initiative like the space station, is making an investment in the future generation of this great nation, then send your message to Washington by signing the Student Space Action Interactive Petition.

SPACE STATION: IT'S ABOUT LIFE ON EARTH!!

Your voice does count! And it WILL make a difference!

Sincerely,

Student Space Action

Subject: Sat reception
To: ham-space@ucsd.edu

A few days ago I read a posting from someone who had modified a
scanner, a PRO-2006 I believe, for satellite reception, with the
offer to post or send the details. I'm interested in hearing what
can be done with this mod, especially if packet can be recieved. I
have a Paccomm PSK-1 Satellite Modem being driven by an older MFJ
-1270 TNC. If this can be wired into the scanner and work, I'd
certainly like to give it a try. On a slightly different note,
I'd be interested in finding mods to the Uniden 2600 for expanded
coverage (26-30MHz) or info on modifying a old TS-670 with the
general coverage option to do the same. Anyone had any luck with
either of these? If so, I'd be interested in if either can be used
to drive a transverter and how it has been done. Please respond to
WA4YMZ@AOL.COM or, preferrably, Gary Rogers@DGC.ceo.dg.com. Tnx in
advance. Gary WA4YMZ
P.S. ftp info on either of these would be great!

864. PRO-2006 as satellite receiver

Newsgroup: rec.radio.amateur.space
Date: 1994-06-14 15:11:57 UTC
From: bmm1@freenet3.scri.fsu.edu
Message-ID: <2tkhbt$l8a@freenet3.scri.fsu.edu>
Source record: 27568

A few years ago I bought a PRO-2006 scanner with the hopes that I could use it to receive the OSCAR satellites. As it turns out this versatile programmable scanner can be used in the down link for all the digital satellites to date. Here are the modifications and operating procedures that I have used with the PRO-2006 scanner for use as the down link receiver for the digital OSCAR satellites.

First of all, in response to several questions, the PRO-2006 will receive 1200 baud AFSK (typical terrestrial packet and DOVE DO-17 (145.825MHz) telemetry) without modification. Simply connect the external speaker jack to a TNC. Any TNC that will work with terrestrial packet BBSs will demodulate DO-17 telemetry. A 2 Meter antenna typical of that used for FM voice or packet will suffice. (DO-17 also transmitted synthesized voice shortly after launch in 1990 and I understand will be doing so again soon, after a long silence). I use a couple of adapters that came from Radio Shack to adapt my type N and PL259 coax connectors to the PRO-2006's BNC antenna jack. I don't think that the little telescoping antenna will pick up DO-17 well enough to demodulate much telemetry.

My next attempt at satellite reception was PACKSAT AO-16. This satellite transmits 1200 baud PSK modulation. In addition to the PRO-2006 I use my HF rig, a Kenwood TS-430S, and an L.L.GRACE DSP-12 TNC. Since the PRO-2006 doesn't demodulate single sideband I use it as a very wide band down converter feeding signals to my HF rig. This is a very simple modification. I tapped off the cathode of D33 with a 10pf capacitor and a few inches of RG 174 coax to a phono/video type connector that I added to the back panel. D33 is inside the top cover about 3 inches back from the front panel and 2 inches over from the left side of the linear PC board. The glass cased diode is end mounted and the cathode is the end pointing up.

This gives you access to the 455KHz final IF signal just prior to the PRO-2006's demodulator circuitry. The signal has a bandwidth of about 8 to 10 KHz. My HF rig has a transverter input on the back that I connect this signal to. You could also connect it directly to the HF rig's antenna jack but if you were to accidentally key the HF transmitter the PRO-2006 would be toast! Next tune your HF rig to 455KHz upper sideband and, using AO-16 as an example, the PRO-2006

to 437.050 MHz. Because the signal bandwidth is at least 8 KHz wide you can tune your HF rig to cover much of the Doppler shift during a pass. When your HF rig's dial reads 451 KHz you will be receiving 437.046 MHz. The DSP-12 (and other PSK TNCs) uses a phase locked loop to track Doppler shift by generating "mike click" signals. These you send to your HF rig. This setup will work with AO-16, WO-18, LO-19, FO-20 and IO-26 (although I haven't tried IO-26).

440 MHz signals are subject to much more attenuation in the coax than 144 MHz signals. I needed 50 feet of coax to get above the trees and even with very high quality coax (4XL) I needed a mast mounted preamp. The preamp made a huge difference.

The above modification also lets you use your HF rigs entire front end, including the signal strength meter, at any frequency that the PRO-2006 will receive. Try listening to some of the odd signals across the bands in SSB or with your HF rigs FM section. Very interesting.

Next I was ready to tackle the 9600 baud FSK satellites. This requires an additional modification, as simple as, and much like the one described above. 9600 baud FSK data contains wave form components that are too high in frequency to make it through the audio amplifier section of most, if not all, radio receivers. This, by the way, leads to the rather confusing fact that if you tune in to a 9600 baud FSK signal you will not hear anything that sounds like 1200 baud AFSK or PSK. What will happen is that the signal will solidly break the squelch but it will sound very much like background noise. "T" the output from this modification out to an oscilloscope however and you can readily see the difference. With experience you can hear the difference as well.

Make this modification exactly like the last one but leave out the capacitor. Solder the center conductor of the coax to TP2. That's it. TP2 is located about one quarter of an inch toward the left front corner of the PC board from diode D33 where the previous coax was terminated. It looks like an end mounted resistor with no bands on it and the top lead cut off short. Run this signal to the 9600 baud FSK input of your TNC, tune to a 9600 baud satellite and if everything worked at 1200 baud you should have no problem at 9600.

There is a serendipitous feature of the PRO-2006 that provides automatic Doppler compensation with 9600 baud FSK. I will use UO-22 which transmits on 435.120 MHz as an example. The PRO-2006 has 10 programmable "limit search" memories (enough for 10 satellites). Program the upper limit of search to 435.130 MHz and lower limit to 435.110

MHz. Then press the down arrow so that the search progresses from higher to lower frequencies, the direction of Doppler shift. Set the squelch at about one and a half and the radio will lock onto the signal when the satellite comes into range, then follow the Doppler shift until it goes out of range. When the signal fades deep enough to return to search mode the search wraps around and locks on again within fractions of a second after the signal returns. Use the delay option to minimize return to search mode. With the frequencies for each satellite programmed into a different limit search memory you can change satellites with the press of a single button.

Considering the price of radio equipment I think the PRO-2006 with these modifications gives you very good "bang for the buck". Many people already own an HF rig and a 2 meter rig by the time they decide to get into the satellites. All mode 440 MHz rigs are quite pricy and AO-21 is the only low earth orbit satellite with a 440 MHz uplink.

Anyway I hope this helps. Good luck.

Bruce N4USH

> function with greater accuracy?
>
> The computer clock problem seems to be a common one (from comments heard on
> AO-13.) Any info on the subject would help.
>
> Ken Durham K5MBV
>
>
Judging from the K5MBV, I would think the obvious solution would be to use
WWV HF service on 2.5, 5.0, 10.0 or 15.0 MHZ would be an easy solution to
the cost problem.

Your manual setting of the clock ought to be within a second or so, which
seems close enough unless you have a _real_ narrow beam.

Another choice would be to use this problem as an excuse to buy yourself
a hand-help marine GPS receiver for about $500.00, about the cost of a
specialized pc-card. I think some of them will display the time that they
use for their position calculation.

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September 1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to note the rmgroup of rec.radio.amateur.packet, and to officially retire some (in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I considered the 970H but wound up buying the 736. The 970H has a great set of features, it makes enough power you don't need an external amp, and the human factors boys did a good job on the controls, but the receiver isn't quite up to the standards of the 275/475 Icoms (they're the best). It folds under conditions of strong adjacent signals. Perhaps the synthesizer has too much phase noise. I checked 5 of them, and they all were the same. It'd probably be fine in a RF quiet location. It's also much more expensive than the other radios.

I bought and quickly sold a Kenwood 790A, that radio was a huge disappointment. Not only were the human factors horrible, but it had serious flaws for satellite use. The narrow filters only work in the main band unit, but you listen to the satellite on the sub-band unit, so they're a waste. It won't do sat-track tuning unless you hold the SAT button down. That's just stupid, requiring you to use both hands to tune the radio. And the thermal design of the radio is horrible. It gets very hot after only brief transmissions. The UHF amplifier brick died after a month. The receiver is pretty sensitive though, but that's not a real issue for satellite since you'll be using a mast mount preamp anyway.

So I finally settled on the 736R. You can't listen to two bands at once like the other two, some of the function controls are laid out funky, the discriminator center meter doesn't center, but it works fine for satellites, the narrow filters work, it never runs hot, and it's been rock reliable. It seems I don't have a lot of good things to say about this radio, but that's misleading. It's very competent at what it does, and what it does is what you need for satellite work. I also got a great deal on it.

My ideal station though would be the IC275H/IC475H. The twins are just wonderful radios, great receivers, rock reliable transmitters, good control layouts and functions, but I couldn't justify the cost. Each individually costs more than a street priced 736R.

On the subject of antennas I'm adamant, there's no substitute for the KLM22C and KLM40CX. They're simply better than anything else available. Use a Yaesu 5400B dual axis rotator system, fiberglass crossboom, SSB Electronics preamps, hardline, and a TAPR Trakbox,

and you have an ideal antenna system. That's *the* key to satellite operation.

Gary

I have heard a legend that a college radio station (either at MIT, Tufts, or Swarthmore) welded antenna to railroad tracks, and peeved the FCC by broadcasting nationwide. Is this true? If anyone knows, please email me (or post here) If you do know, could you please direct me to some documentation regarding this legend if you can.

This is very important! Thanks in advance.

HI!

I am considering buying a shortwave radio guide book.
Here are 3 three books to choice.
1.Passport World Band Radio 1994
2.1994 Edition Wordldradio TV Handbook
3.Shortwave Listening Guide Book, Harry Helms, Second Edition
Do you have an opinion on which one of these is better for my to buy ?

Please send mail to idpt783@tpts1.seed.net.tw preferably.

thanks a much !
-Percy WANG

Doubtful, very doubtful. Railroad tracks are grounded at semi-regular
distances up and down the tracks. Unless the frequency exactly matched
the distance between the grounds it would have very poor performance.

Kevin

Hello,
I have never read this newsgroup, and only recently dug up an old Sky&Tel
in which there are plans for making a directional antenna to observe Jupiter.
The problem is that my short wave radio broke down. Does anyone have any
ideas of how to get one for one day only ? (the Shoemaker-Levy vs. Jup.)
I was thinking of buying one and then returning it. Any help and extra info
on how to observe this event (frequency ?) would be greatly appreciated.
Thanks.

Not clear where your are calling from, but if UK (or US/Europe) I suggest you request them all from your local library, then make an informed choice, if any still needed. We need to use our libraries before they are taken away in government cuts !! Usually libraries are only too happy to dig things out, or find them elsewhere, or even buy fresh.

I have a friend who is looking for a unix based program that can steer a satelite antenna i.e can track a satellite in an inclined orbit. Anyone know of such a program? If possible could you please send any replys to my friends internet address: dave@.ncs.co.nz but if this isnt possible I will be reading the newsnet board.

P.S he is also interested in the address of any place that sells 2nd hand satellite equipment i.e antennas etc.

Cheers
Mark

That is not a shareware program. The program is made by
Paul E. Traufler. If you want more information about
WinTrack please contact to him. Address is

Paul E. Traufler
111 Emerald Drive
Harvest, AL 35749
U.S.A

Leo Wikholm, OH2JEC

Can anyone tell me if any of the images generated by amateur satellites
have been made available for download in any other place besides directly
from the satellites themselves (eg. FTP or BBS downloads) ?
Thank you.

John.

887. Wefax on R-7000

Newsgroup: rec.radio.amateur.space

From: "l.h. bol" <lbol@julian.uwo.ca>
Message-ID: <2tuvtq$7cs@falcon.ccs.uwo.ca>
Source record: 27584

Has anyone used the IF output of the R-7000 to drive a wide band IF system for the reception of Wefax and/or APT ? If so, can you provide info on the outboard IF system you used ?

lbol@julian.uwo.ca

888. Information Re: Satellite contacts on FD

Newsgroup: rec.radio.amateur.space
Date: 1994-06-18 19:19:32 UTC
From: SKSW80A@prodigy.com
Message-ID: <013.00861524.SKSW80A@prodigy.com>
Source record: 27589

Greetings.

I have never made a satellite contact on the OSCARs but am interested in doing so on FIELD DAY. I am in charge of field day at our local club here in Michigan and it will be my first attempt to work the satellite.

I have a program called TRAKSAT which will use the 2liners elements that are published on internet in this newsgroup to track the satellites but I have a few problems in using the output the program calculates for lack of additional information.

1. I am not sure what all the appreviations on the NASA format printout are for each satellite (i.e. I have heard that RS-10/11 is OSCAR 10 and OSCAR 11, but I don't know what AO-21, and many of the other satellites listed on the 2liners list. Is there a cross reference published somewhere on the net such in a mail-server from AMSAT or something like that?)

2. I need to know how to find out which mode a particular satallite is in or is suppose to be in during Field day, and what frequencies are being used for that mode. (or any day for that matter).

3. If I know which satellite I'm working, and I know which mode it is in, reference material should tell me the frequencies. However, my reference material on the satellites only covers some of the earlier models. Is there current information on the net regarding the new satellites and their modes of information?

Thanks to all who respond.

Jeff Johnson
KF8UW President, Blossomland Amateur Radio Association GRID EN-62
We will be using our club callsign W8MAI during field day.

890. USED 10 METER COMMERCIAL ANTENNA FOR TVRO

Newsgroup: rec.radio.amateur.space
Date: 1994-06-19 19:18:51 UTC
From: Richard.Weening@Mixcom.com
Message-ID: <Richard.Weening.61.000E50DA@Mixcom.com>
Source record: 27593

WANTED...a 10 Meter Commercial Satellite Dish capable of zero degree on the horizon. An out-of-compliance 2-way dish if reasonable condition not operated near salt water may fill the fill. We have a licensed group who can disassemble and ship. Our application is TVRO so we need only one port. While the actuators should be in place, we do not need motors as we only need to watch a single bird.

Please forward details to GEMTECH@connectinc.com

SB SAT @ AMSAT $ANS-168.01
1994 AMSAT FD COMPETITION

HR AMSAT NEWS SERVICE BULLETIN 168.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 18, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-168.01

1994 AMSAT Field Day Competition Announcement

Field Day is once again just around the corner on June 25th and 26th, and we are proud to announce the 1994 AMSAT Field Day competition. Last year's effort was very successful and we will be using the same special rules. The AMSAT competition is to encourage the use of all amateur satellites, including the digital satellites.

Here are the rules for the 1994 AMSAT Field Day competition.

1. ANALOG TRANSPONDERS

Each satellite is considered a separate band. All phone QSO's and all CW QSO's on a given satellite are considered separate bands. All packet/RTTY /ASCII/AMTOR QSO's are counted as CW QSO's. Phone QSO's count for one point and CW QSO's count for two points. Cross-mode contacts are not allowed. The use of more than one transmitter at the same time in a single band is prohibited.

2. DIGITAL TRANSPONDERS

Each satellite is considered a separate band. The following uploads/downloads each count as a CW contact (two points):

(a) Upload of a Satellite Field Day Greetings file.
(b) Download of Satellite Field Day Greetings files posted by other stations.

Satellite digipeat QSO's do not count for any score. The use of gateway stations to uplink/downlink is not allowed.

SAMPLE SATELLITE FIELD DAY GREETINGS FILE:

"Greetings from WA5ZIB Field Day Satellite station near Galveston, Texas with 24 participating members. All the best and 73!"

3. OPERATING CLASS

Stations supplied only with emergency power are in a separate operating class from those that utilize commercial power.

The Satellite Summary Sheet shown below should be used for submittal of the AMSAT Field Day competition results to Andy MacAllister WA5ZIB, Vice President User Services, 14714 Knights Way Drive, Houston, TX 77083-5640. Deadline for submissions is August 1, 1994.

Competition was tough in 1993 and should be even tougher in 1994. We hope this competition provides satellite operators with the practice necessary to be able to set up a ground station and effectively operate the satellites in an emergency situation. Remember that Field Day also provides a good opportunity to give some newcomers a chance at operating the satellites. Most of all, it should be a lot of fun for all who participate.

GOOD LUCK ON FD!

AMSAT Board of Directors Nominations Announced

Martha Saragovitz, AMSAT's Corporate Secretary announced June 16, that six duly executed nominations for the organization's Board of Directors have been received at AMSAT Headquarters by the June 15th deadline mandated in the Radio Amateur Satellite Corporation Bylaws.

Ms. Saragovitz listed the nominees as: Keith Baker KB1SF, Tom Clark W3IWI, John Hansen WA0PTV, Andy McAllister WA5ZIB, Lou McFadin W5DID and Bob Myers W1XT.

The Corporation's Bylaws require that ballots for the Board election be mailed to all current members by July 15. To be counted, the properly marked ballots must be received at Headquarters by September 15. The three persons receiving the most votes will be declared elected to the Board for a two year period. The two receiving the next largest number will become Alternate Board members until next year's Board is seated at its fall 1995 meeting.

The current Board members who's terms expire this year are: Tom Clark W3IWI, Joe Kasser G3ZCZ and Andy McAllister WA5ZIB. Four other Board members were elected in 1993 and are scheduled to serve until next year. They are: Junior deCastro PY2BJO, Dick Daniels W4PUJ, Bob Diersing N5AHD and Bill Tynan W3XO.

The current Alternate Board member is Joe Holman KA7LDN.

894. Student Pro Space Station Petition

Newsgroup: rec.radio.amateur.space
Date: 1994-06-20 16:33:49 UTC
From: gamageb@news.db.erau.edu
Message-ID: <2u4gdd$ri4@blackbird.db.erau.edu>
Source record: 27597

Dear Colleague:

Student Space Action would like to inform you of a way
in which you can directly voice your support for manned
space exploration. As you read this, your space program is
in danger of becoming extinct. Congress is once again
attempting to eliminate space station funding. Cancellation
of the space station could mean the phase-out of space exploration
and eventual termination of aerospace industries and job
opportunities. The resulting impact on the nation's economy,
technology and educational system would be disastrous.

You can tell your congressmen exactly how much you support the
space station and the manned space initiative by signing the
Student Space Action's Interactive Online Petition. Simply follow
these steps:

telnet seds.lpl.arizona.edu
login> space

Now answer the questions to the best of your ability
(read the directions accompanying the petition--
use <tab> to enter answer; <enter> to toggle yes/no;
up/down arrows to go backwards and forwards through
questions. Caution: if floating characters appear on
your screen--ignore--it's probably just an emulation
problem. Your petition will still be signed.

After you submit the petition, you will receive information
on your congressmen and senators so you can contact them further
by phone or mail if you desire.

The petition is also accessible by NCSA Mosaic. Simply go to the
following URL and follow the directions:

URL: http://seds.lpl.arizona.edu/ssa/petition.html

Answer the questions and submit the petition and you
will receive the same information as the telnet version.
You will also have the option of linking to the space
station home page where you can read up-to-date information
on the space station, including issues of "Space Station
This Week."

Please forward this message to anyone you may feel would want to
be a part of this effort--everyone!

If you believe the space program is a vital part of our country's future, both in economic growth and technological advancement, then sign the Student Space Action's Interactive Petition.

If you believe that NASA should remain as an engine for continued manned space exploration, then tell everyone you know to sign this petition.

If you believe that our government, by supporting an initiative like the space station, is making an investment in the future generation of this great nation, then send your message to Washington by signing the Student Space Action Interactive Petition.

SPACE STATION: IT'S ABOUT LIFE ON EARTH!!

Your voice does count! And it WILL make a difference!

Sincerely,

Student Space Action

SpaceNews
=========

MONDAY JUNE 20, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* IMPACT WITH JUPITER *
=======================
JPL's Galileo spacecraft is scheduled to observe 16 of the 21 possible impacts of the fragments of Comet Shoemaker-Levy-9 with Jupiter this July, according to project scientist Dr. Torrence Johnson. Galileo is scheduled to observe 16 of the 21 possible impacts of the fragments of Comet Shoemaker-Levy-9 with Jupiter this July.

Galileo, however, won't be alone in keeping its eyes on Jupiter. Although the Galileo spacecraft will be in the best position to view Comet Shoemaker-Levy-9's impact with Jupiter, Voyager 2 and the Ulysses spacecraft will record various measurements from the event.

On its way out of the solar system, Voyager 2 will be heading south, about 6 billion kilometers (3.7 billion miles) from Jupiter, and will have the comet's impact sites in its line of sight. The spacecraft will observe with its ultraviolet spectrometer and planetary radio astronomy instrument, and numerical data will be returned in real time.

The Ulysses spacecraft, on its way to explore the sun's polar regions, will be able to make measurements of radio and plasma waves from the comet's impact from its position at about 75 degrees south of the sun's equator and about 800 million kilometers (500 million miles) from Jupiter.

JPL's Deep Space Network facility at Goldstone, California will perform radio astronomy on the synchrotron emission from Jupiter's radiation belt, looking for disturbances caused by Shoemaker-Levy dust.

[Info via Ron Baalke at JPL]

* MIR NEWS *
============
Progress M-23 docked with the Mir complex at 0618 UTC on May 24. The EO-15

commander and flight engineer, Viktor Afanas'ev and Yuriy Usachyov, will be replaced this month by the EO-16 crew, Yuriy Malenchenko and Talgat Musabaev, who will be launched on the Soyuz TM-19 ferry ship on June 20. Physician-cosmonaut Valeriy Polyakov will remain aboard Mir. Both Malenchenko, a Russian Air Force cosmonaut, and Musabaev, a Kazakh Space Agency cosmonaut, will be on their first flights.

[Info via Jonathan McDowell]

* AO-10 NEWS *
==========
JH0OTM in Japan reports getting a strong return downlink from AMSAT-OSCAR-10 on 13-Jun-94 at 23:30 UTC. The beacon carrier on 145.810 MHz was also strong at a range of 23000 km. With signals from AO-10 steadily improving, JH0OTM is looking forward to making contacts via AO-10's Mode B transponder.

* DOVE NEWS *
==========
DOVE-OSCAR-17 continues to exercise its voice capabilities. Downlinks can be heard on 145.825 MHz FM. The following packet frame was received from by spacecraft by KD2BD late last week:

DOVE-1>BRAMST <UI>:

Greetings to attendees at the ARRL National Convention and
Education Forum from the DOVE Command Team
(WD0E)

* SPACE CALENDAR *
==========
The following is a tentative calendar of space related events for the next several weeks.

Jun 20-23 - International Conference of Environmental Systems, Germany
Jun 24 - UHF Follow-On Atlas Launch
Jun 24 - Soyuz TM-19 Launch (Russian)
Jun 25-26 - Space Auction, Superior Galleries, Beverly Hills, California
Jun 25-26 - Universe 94 Conference, Flagstaff, Arizona
Jun 27 - Ulysses, Begin of 1st Solar Passage (-70.07 degrees latitude)

Jul 04 - Soyuz TM-18 Landing (Russian)
Jul 08 - STS-65, Columbia, International Microgravity Lab #2 (IML-2)
Jul 09 - 15th Anniversary (1979), Voyager 2, Jupiter Flyby
Jul 11 - 15th Anniversary (1979), Skylab Re-enters Earth's Atmosphere
Jul 16-22 - Comet Shoemaker-Levy 1993e Collision with Jupiter
Jul 16 - 25th Anniversary (1969), Apollo 11 Launch
Jul 20 - 25th Anniversary (1969), Man on the Moon (Apollo 11)
Jul 28 - 30th Anniversary (1964), Ranger 7 Launch (Moon Impact Mission)
Jul 28 - DirectTV Atlas II Launch
Jul 31 - 25th Anniversary (1969), Mariner 6, Mars Flyby

[Info via Ron Baalke at JPL]

* FO-20 NEWS *
==============
On 19-May-94, the FO-20 command station announced that a problem exists
in FO-20's onboard computer system. The satellite's transponder will
remain in the analog mode (JA) until further notice.

[Info via Kazu Sakamoto, JJ1WTK]

896. Satellite FAQ is very helpful for preparing for Field Day.

Newsgroup: rec.radio.amateur.space
Date: 1994-06-21 14:16:18 UTC
From: johnsoj@autsb.allied.com
Message-ID: <199406211416.JAA07654@news.cs.utexas.edu>
Source record: 27598

Since I posted my question regarding how to make a satellite contact on field day, and since no one responded to that message, I figured that there must me some information (read FAQ) at one of the known amateur radio mirror sites. I must have missed when it was posted to this newsgroup.

I ftp'd to oak.oakland.edu:/pub/hamradio/docs/faq and got the file faq_sats.txt. This document is very helpful to me. With this in hand, along with the output for my location from one of the tracking programs which uses the 2liner element sents for the Satellites, I will be in fine shape for field day.

I hope that this message will be helpful to other hams interested in trying to work a satellite on field day.

KF8UW

I would like to know if any of you "Packet Hackers" have any info. on a Contronics C200 Micro Earth Station.
It was manufactured by Contronics. The division that made it is no longer in operation. It was bought out by GTE Spacenet. They will not give me any info on it. Depending on who you talk to you will get conflicting stories. Some say the info is proprietary some say it is not. The only info they have sent me is for a 40 foot earth listing station. The one I have is a scaled down model. ie:2.5 meter.
I hope to use this for packet radio someday. I am in the process of acquiring my "Ham" license now. Can anyone tell me how to use this "dish" and controller for listening purposes.
The "dish" came from a Farmers insurance agent that went out of business. I acquired it at an auction.
I can be reached at colink@kira.csos.orst.edu Thanks...Colin.

904. Relays

Newsgroup: rec.radio.amateur.space
Date: 1994-06-21 23:09:39 UTC
From: tom_boza@ccm.hf.intel.com
Message-ID: <2u7sll$442@chnews.intel.com>
Source record: 27603
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.antenna,intel.ham-radio

Can anyone tell me where I might find (purchase cheaply) some 12-24 VDC
relays that I can use to switch in/out my 2m and 70cm antenna preamps?
I need to take the premaps out-of-line before transmitting. They need to
operate at 145 and 443 MHz with minimum signal lost and capable of handling
150 watts of RF output power. I perfer PC mount type so I can mount them inside
the preamp bud box. Coaxial relays (Dowell or TohTus) are big and require coax
connectors.

Thanks, Tom WB7ASR...

905. Macintosh tracking programs

Newsgroup: rec.radio.amateur.space
Date: 1994-06-22 02:44:40 UTC
From: winter@apple.com
Message-ID: <2u88io$pco@apple.com>
Source record: 27605

I've seen some requests for Macintosh satellite tracking programs
on this newsgroup recently. Here are the ones listed in Terry
Stader (KA8SGP)'s Mac ham software list.

FWIW, I use SatTrak and MacSPOC myself.

Patty

============================== Patty Winter ==============================
Apple contractor Internet: winter@apple.com
Sunnyvale, California AMPRNet: 44.4.4.44
"Here I've been talking with the most intelligent people
in the world, and I never even noticed." --Columbo
================================== N6BIS ==================================

<SatTrak v1.02>
Tracks one satellite across a world map as it moves, displays the
instantaneous position of several satellites, or generates tables of
all satellites visible from a certain location at a given time. Also
calculates beam headings, Maidenhead grid locations, and MUFs.
Shareware. Available via anonymous FTP from sumex-aim.stanford.edu
(/info-mac/app). Or send a formatted 800K Macintosh disk with
stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207
W. Beverly Lane, Glendale, AZ 85306.

<MacSat v3.1>
Tracks up to 21 satellites simultaneously, either in simulation or
real-time mode. Text screen displays ground-track coordinates,
range, mean anomaly, visibility (azimuth and elevation) and Doppler
shift frequency information for all satellites being tracked.
Graphical screen portrays the satellite ground tracks superimposed
on a world map. Polar plot displays graphically the precise location
of each visible satellite above the observer's horizon. Developed
by the Geodetic Research Laboratory of the University of New
Brunswick. Available from Richard B. Langley, R.R. 12, Fredericton,
N.B. E3B 6H7, Canada (Internet: lang@unb.ca). A demo version of
MacSat may be ftp'ed from directory PUB.CANSPACE on unbmvs1.csd.unb.ca.
System 7

<OrbiTrack> <OrbiTrackFPU v2.1.4>
Calculates look angles to selected satellites, plots current
satellite positions on a world map, and displays the visible passage
of a satellite against background stars (either within the program
itself or via a data file that can be read into the Voyager
astronomy program). Please note that one version requires an FPU to
operate! BEK Developers, P.O. Box 47114, St. Petersburg, FL 33743.

(Bill Bard, CompuServe: 75366,2557) (Note: This replaces BEK's previous MacSat program, which was not related to the program of the same name from UNB.)

<QuikMac>
Macintosh version of N4HY's QuikTrak program. Requires Microsoft BASIC. AMSAT, P.O. Box 27, Washington, DC 20044.

<Satellite Orbit Prediction Program>
Macintosh conversion of W3IWI program. Requires Microsoft BASIC. Send formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015. Or send self-addressed stamped envelope for source listing.

<Satellite Pro>
Uses world maps and tables to indicate rising and setting schedules, current locations, mutual visibility opportunities, and footprints. Includes Mercator, polar, and great-circle displays. Optional antenna control. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98366.

<Macintosh Spacecraft Personal Orbit Computations (MacSPOC)>
Software used aboard the Space Shuttle and in Mission Control to track the Shuttle. Models engine burns, orbit perturbations, and the Shuttle's orientation. Free online data uploads during Shuttle missions.
Commercial v1.5 available from Daniel R. Adamo, 4203 Moonlight Shadow Ct., Houston, TX 77059; telephone 713-480-9631; AppleLink: D3176; America Online: AdamoD. Test drive v1.1 available on AppleLink (path "K-12 Education: Education Resources: Science Resources: MacSPOC: Space Shuttle Orbit Software"). Author is on AOL and can be reached as adamod@aol.com via the internet.

I have been using an L.L.Grace DSP-12 for about a year now and am
happy with it. It is a very powerful piece of equipment and is under
utilized with it's present firmware. Is anyone doing any programming
for this device? Is firmware version 2.0 the latest? Is the AEA DSP
unit programmable and if so are programs written for it compatible
with the DSP-12? Any info or opinions welcomed.

Thanks

radio.amateur.space
TS>Organization: America Online, Inc. (1-800-827-6364)

TS> I've been saving the 2 line element sets from this newsgroup and
TS>they are NOT working with stsorbit plus. I remove the info before the
TS>actual set and the program will not read it. I don't quite understand
TS>why. Any help would be appreciated through e-mail. In the meantime,
TS>I'll have to go elsewhere for the latest sets. Thanks!

TS>Tom

TS>randall@sunydutchess.edu

I believe that the information posted in r.radio.space is in the form of
Keplerian data and the stsplus software uses 2-line element sets. While
these contain essentially the same data, the format is different.

However, the version of the software I have contains an option to
manually input the Kep data from the posted listing and it (the
software) builds the 2-line element set. I can't remember offhand just
what version I have......

Someone who uses this stuff regularily can probably give a better
explaination.....

Bruce M. Marshall (bmm1@freenet3.scri.fsu.edu) wrote:
: I have been using an L.L.Grace DSP-12 for about a year now and am
: happy with it. It is a very powerful piece of equipment and is under
: utilized with it's present firmware. Is anyone doing any programming
: for this device?

There have been some interesting applications developed but they are few and far between. I have an oscilloscope program that Brooks gave me a year or so ago (but I don't know whether it is available for public distribution). Also right now there are some audio filters posted on Ko-23. I've not tried them yet but they look interesting.

: Is firmware version 2.0 the latest?

yes
: Is the AEA DSP
: unit programmable and if so are programs written for it compatible
: with the DSP-12? Any info or opinions welcomed.

They are not compatible... if I'm not mistaken it even uses a different DSP chip.

You may or may not know that LL Grace has a developer's kit for sale for $25. I know Brooks has been puzzled as to why there has not been more development activity. One reason, I think, is that there is no way to upload additional programs to the unit. If you upload new firmware it replaces what is in ROM, it doesn't augment it. So you go through an upload proceedure to put an additional program in, but the next time you want a 9600 baud modem you have to default to the ROM, but if you want the new program you have to upload it again. You really have to think twice before deciding to upload

Help!! Need freqs and specs for any satellites workable on HF, and
on 10M - 2M - 440, as well as modes (CW, FM, SSB, whatever), whether
they're mirror image, could hit with low ERP, etc.

Sorry for blanket ignorance. Tnx Bob

I don't know whether there are any experienced programmers out there who would be willing to help me out but here is the problem. For my final-year degree project I am building an automatic satellite tracking system and I need to know how to calculate the current position of a satellite from Keppler Elements.

I presume all that is required is a few formulas, functions of time, but my maths is not up to working it out the hard way. If anyone knows what these formulas are and could mail them to me I would be grateful. (You will be sure to get your name in the acknowledgments.)

I am writing the software in C, if that helps any. Please send any mail direct - preferrably to the address as the bottom of this post - and I will summarize if there is anything of interest.

Thanks in advance,

-Niall

Gear: Trakbox with 3.20beta ROM
Yaesu 736R

Problem: Can't get CAT control to work

I have connected the CAT control from CN4 pins 2 (inverted TTL)
and 5 (GND). Now and then the radio goes into CAT mode but it
won't trak the frequency right. Are there any quirks to get it
working properly?

If you have a similar configuration please write and tell me
about how it works for you.

The following is a list of anonymous FTP sites where metereological
images in GIF format can be found.

73 de Guillermo.

=-=
CLIMLIST Mailing Number 92-08-19
Forwarded From: USENET newsgroup sci.geo.meteorology
Origin: ilana@ncar.ucar.edu

==Current weather GIFs via FTP==

vmd.cso.uiuc.edu [128.174.5.98]
FTP: Change directory to "wx" and set transfer type to "binary".
GOES-7 visible and IR imagery over the US and Mexico, and surface analyses
over the US, are available. A script to retrieve GIFs automatically is
available from the ncardata FTP area (see below).
Also available in this directory are SPOTFREQ.DOC and CHASE-TV.DOC,
lists of ham radio frequencies and TV stations which carry useful info
for storm chasers, and a few other useful documents.

uriacc.uri.edu [131.128.1.1]
FTP: Change directory to "davet.195" and set transfer type to "binary".
Images of the northeast US in GIF format from the afternoon passes of
NOAA-11. (Provided by Dave Tetreault, DAVET@uriacc.uri.edu.)

unidata.ucar.edu [128.117.140.3]
FTP: Change directory to "images" and set transfer type to "binary".
Weather radar summary map GIFS, surface maps for various places, a few
soundings on skew-t log-p diagrams, GOES Hugo images (in subdirectory
"images/hugo"). Surface maps include Europe and China.

cumulus.met.ed.ac.uk
FTP: Change directory to "images" and set transfer type to "binary".
IR and visibal images of Europe from Meteosat, twice daily, in 1152 x 900
GIF format (size of Sun root window). The subdirectory "gifs" has smaller
3x daily images of the Nordic areas, the UK, and Europe.

marlin.jcu.edu.au [137.219.16.14]
FTP: GMS-4 images updated regularly for various Australian states,
the entire country, and for regions/events of interest such as TOGA/COARE.
The images are in a format designed for the package JCUMetSat but can
be converted to GIF format using the ALCHEMY public domain software
available at this site.

ats.orst.edu [128.193.120.19]
FTP: GOES IR and VIS images over North and Central America, plus a

"floater" image which "could be anything." Also Oregon and US city forecasts.

aurelie.soest.hawaii.edu [128.171.151.121]
FTP: Sea-Surface-Temperature data (near-real-time) in "pub/avhrr/images". AVHRR images within the radius of reception of the university's HRPT station, approximately 5 S to 45 N and 125 W to 165 E. The processed images are available usually within 30 min. of NOAA-11 and NOAA-12 passages. Data are compressed binary in netCDF format (get documentation from unidata.ucar.edu, above) labelled by satellite name (n11/n12) and time. More info available from hrpt@hokulea.soest.hawaii.edu.

DAY OPERATIONS
GRNC
BT
UNCLAS

Subj: NACEC Exercise 94-1 to be conducted in conjunction with Amateur
Radio National Field Day Exercise and Army MARS exercise
"State Tempest 01-94"

A. Weather Message traffic received from Amateur Radio Field Day
operations will count as NTS message traffic for points.

1. Requesting assistance from all US, Canada & Mexico with heavy day
participation from the following states WI, NE, IA, and SD in
support of this exercise.

2. Exercise times: start 1701Z 25 Jun 94, end 1659Z 26 Jun 94.

3. Frequencies: primary 3.860 Mhz LSB, secondary 1.955 Mhz LSB
Net Call: KE0EG NACEC/X.

4. Mode of operations: LSB voice

5. Essential elements of information are hourly weather
reports needed from participating stations.
Data: temperature, visibility (in miles), cloud cover(in %),
wind speed and direction.

6. Key players in this exercise: U.S. Army Reserve, U.S. Navy Reserve,
North American Amateur Radio Community, North American
Center for Emergency Communications (NACEC), The Salvation Army,
American Red Cross and the Army, Navy and Air Force MARS programs.

a. Emergency HF radio facilities: 2- ANGRS 122 HF-SSB/RTTY trucks.

b. Antenna for Amateur Radio operations: Inverted V at 400 ft
on broadcast tower.

c. NACEC emergency field radio operators provided by:
U.S. Army Reserve, U.S. Navy Reserve, NARS and the local
Amateur radio community.

7. Exercise scenario: A weather front with extremely strong straight-line winds and numerous tornadoes moved thru St Paul metro at approximately 3:45 am followed by torrential rains causing severe flooding. Damage to the cities of Burnsville, Apple Valley, Rosemount, and Farmington was extremely severe.

Early estimates are that over 1500 homes were destroyed and another 3000 received serious damage. Over 150 apartment buildings (2100 units) have been rendered uninhabitable.

Current estimates are that some 45,000 people have been displaced. Death toll currently stands at 215 and the injured count is currently 2500 persons. Counties most affected were Dakota, Hennepin, and Washington. Damage to the Twin Cities metro was moderate, many homes and businesses were damaged and most metro area communications towers were destroyed.

Telephones and cellular telephones [communications] within the 7-county metro area is off line as is electric power.

Most main roads in the south end of the 7-county metro area are closed due to flooding and debris. Both long and short range communications is being maintained by radio.

Communications is being maintained from two emergency communications sites located a half (1/2) mile apart. These sites are located approximately 3 miles south of Rosemount on Highway 3.

Weather Data is being accumulated to assist the National Weather Service in developing long range forcasts for the disaster area.

920. Mods for ICW-21AT for use with Sats

Newsgroup: rec.radio.amateur.space
Date: 1994-06-23 20:26:55 UTC
From: etuggle@auc.trw.com
Message-ID: <1994Jun23.202655.18633@auc.trw.com>
Source record: 27371

This may be a dumb question, but I'll ask it anyhow...

Is there a mod to allow me to transmit below 440MHz
(ie. 430 - 440)? I know FM is not used below 440MHz
but AO-21's uplink freq is in that range.

Thanx for any help.

73,
Eddie
KB0LZZ, Parker Colorado

Hi David,

Thanks for the info on the satelite tracking program.

Best Regards,
Mark

928. Online (Pro) Space Station Petition

Newsgroup: rec.radio.amateur.space
Date: 1994-06-24 18:26:55 UTC
From: ssa@SEDS.LPL.Arizona.EDU
Message-ID: <2uf8hf$7bk@news.CCIT.Arizona.EDU>
Source record: 27376

Dear Colleague:

Student Space Action would like to inform you of a way in which you can directly voice your support for manned space exploration. As you read this, your space program is in danger of becoming extinct. Congress is once again attempting to eliminate space station funding. Cancellation of the space station could mean the phase-out of space exploration and eventual termination of aerospace industries and job opportunities. The resulting impact on the nation's economy, technology and educational system would be disastrous.

You can tell your congressmen exactly how much you support the space station and the manned space initiative by signing the Student Space Action's Interactive Online Petition. Simply follow these steps:

telnet seds.lpl.arizona.edu
login> space

Now answer the questions to the best of your ability
(read the directions accompanying the petition--
use <tab> to enter answer; <enter> to toggle yes/no;
up/down arrows to go backwards and forwards through
questions. Caution: if floating characters appear on
your screen--ignore--it's probably just an emulation
problem. Your petition will still be signed.

After you submit the petition, you will receive information
on your congressmen and senators so you can contact them further
by phone or mail if you desire.

The petition is also accessible by NCSA Mosaic. Simply go to the following
URL and follow the directions:

URL: http://seds.lpl.arizona.edu/ssa/petition.html

Answer the questions and submit the petition and you
will receive the same information as the telnet version.
You will also have the option of linking to the space
station home page where you can read up-to-date information
on the space station, including issues of "Space Station
This Week."

Please forward this message to anyone you may feel would want to be a part
of this effort--everyone!

If you believe the space program is a vital part of our country's future,
both in economic growth and technological advancement, then sign the

Student Space Action's Interactive Petition.

If you believe that NASA should remain as an engine for continued manned space exploration, then tell everyone you know to sign this petition.

If you believe that our government, by supporting an initiative like the space station, is making an investment in the future generation of this great nation, then send your message to Washington by signing the Student Space Action Interactive Petition.

SPACE STATION: IT'S ABOUT LIFE ON EARTH!!

Your voice does count! And it WILL make a difference!

Sincerely,

Student Space Action
ssa@seds.lpl.arizona.edu

Yeah, well they already got the Super Collider, we predicted last year that
they would come for the Space Station next, and here they are.

The Newark Extras from Rural Delaware State, or N.E.R.D.S., will be holding a 5 watt QRP battery power operation on Field Day from Iron Hill Park, New Castle County, Delaware. We will be on HF, packet and satellite.

Not to mention on top of a large magnetic iron mountain under a metal roof during expected thunderstorms.

Please listen for WN3K and try to work us. Thanks.

>$25. I know Brooks has been puzzled as to why there has not been more
>development activity.
The developers kit was more expensive when I purchased it. Also, it doesn't include any modems (except for a test one I think). The only sample code is the V40 code, not DSP code.

932. help-which radio?

Newsgroup: rec.radio.amateur.space
Date: 1994-06-25 03:52:48 UTC
From: whitestone@ins.infonet.net
Message-ID: <2ug9mg$c9i@insosf1.infonet.net>
Source record: 27381

I am planning to build a amateur satellite station. I am considering the Yaseau 736 R or the ICOM 970A. Has anyone had experience with either or both of these radios that you could pass along to me. I would appreicate it ... Please e mail me with any informaion ...

933. Two-Line Orbital Element Sets (TLE420)

Newsgroup: rec.radio.amateur.space
Date: 1994-06-25 14:28:04 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.772554484@afit.af.mil>
Source record: 27387

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

I'm new into satellite tracking but I have been a ham for some time now.
can anyone tell me what would be a good bird to track, its beacon freq,
time and modes of op and whatever if it can be received with standard
equipment.
Thanks

936. reader

hi alex, i am having some
trouble with my off line reader. it works fine on other bbs and worked
fine here before the big crash of 6-94. HELP!

SB SAT @ AMSAT $ANS-176.01
PHASE 3-D STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 176.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 25, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-176.01

WD4FAB & DB2OS Provide Phase 3-D Status Report

The Phase 3-D Project Leader and AMSAT-DL President, Karl Meinzer (DJ4ZC) hosted six days of meetings, 13-18 June 1994 in Marburg, Germany to assess the status of a number of major areas of the project. In attendance at these meetings was Dick Jansson (WD4FAB), AMSAT-NA's Vice-President of Engineering. As a result of these meetings, the Project has ordered the solar arrays and is on the verge of ordering the spacecraft batteries. The selection of the machining contractor for the large aluminum rings for the 2624mm diameter SBS (Spacecraft Bus System) was also discussed and is quite close to being ordered. The SBS, which will be fabricated at Weber State University (WSU) in Ogden, UT, is a large cylinder that is part of the load carrying structure of the Ariane-5 launch vehicle. The Phase 3-D spacecraft is housed inside of the SBS for the ride into orbit.

Discussions were also held with Danny Orban (ON4AOD) on design refinements of the Ku Band transmitter (24 GHz) being constructed in Belgium. Some of these Ku Band transmitter refinements may also be applied to the X Band transmitter being constructed by the AMSAT-OH group at the Helsinki University of Technology in Finland.

One day of the meetings was devoted to very detailed discussions with Bernard LaCoste of the European Space Agency (ESA) regarding the launch configuration of the AR-502 vehicle and the testing that AMSAT will need to do inorder to qualify the Phase 3-D spacecraft and the SBS for their launch on AR-502.

Within the next month, AMSAT will conclude the ordering of the major components noted above. Also, in this near time period, the "flight" spaceframe will arrive at the Florida integration facility and start its final cleaning, paiting and assembly. The integration facility, located at the Orland Internation Airport, is in the final stages of being prepared for its mission of providing the specialized environ-ment for the spacecraft assembly activities.

[The AMSAT News Service (ANS) would like to thank WD4FAB and DB2OS for this bulletin item.]

SB SAT @ AMSAT $ANS-176.02
WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 176.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 25, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-176.02

Weekly OSCAR Status Reports: 18-JUN-94

AO-13: Current Transponder Operating Schedule:
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 May 07-Jul 11
Mode-B : MA 0 to MA 170 |
Mode-BS : MA 170 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Alon/Alat 230/-5
Mode-B : MA 250 to MA 256 |
Omnis : MA 250 to MA 120 | Move to attitude 180/0, Jul 11
[G3RUH/DB2OS/VK5AGR]

KO-25: The uplink of the KO-25 spacecraft has been recently switched to
145.870 MHz. In addition, the control station is indicating that a
reset of the On-Board Computer (OBS) is planned for 20-June-94.
[K6OYY]

DO-17: DO-17 still continues to transmit its voice message on a downlink
frequency of 145.825 MHz.

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly
OSCAR status reports. If you have a favorite OSCAR which you work on a
regular basis and would like to contribute to this bulletin, please send
your observations to WD0HHU at his CompuServe address of 70524,2272, on
INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO
area, WD0HHU @ W0GVT. Also, if you find that the current set of orbital
elements are not generating the correct AOS/LOS times at your QTH, PLEASE
INCLUDE THAT INFORMATION AS WELL. The information you provide will be of
value to all OSCAR enthusiasts.

>equipment.
> Thanks

There are several good one to get started on. Here are few easy
ones you can try for:

DO-17 145.825 MHz FM voice and AX.25 1200 baud packet telemetry
AO-21 145.987 MHz FM voice repeater and AX.25 1200 baud telemetry
AO-27 436.800 MHz FM voice repeater
Mir 145.550 MHz FM voice and AX.25 1200 baud packet BBS

All of the above should provide good results with an outside antenna
or from a mobile setup. Note that the frequencies listed will shift
from slightly higher to slightly lower than shown as the satellite
passes over due to the Doppler effect.
Good Luck!

940. decoding telemetry by telephone modem ?

Newsgroup: rec.radio.amateur.space
Date: 1994-06-27 13:51:31 UTC
From: juergen.putzger@physik.uni-regensburg.de
Message-ID: <juergen.putzger.16.0@physik.uni-regensburg.de>
Source record: 27394

Hi,

I would like to decode the telemetry of DOVE-OSCAR17. Is it possible to do this with an ordinary telephone modem (Hayes compatible, max. 2400 Baud) ? The transmission rate is 1200 Baud AFSK (like packet radio). A circuit will be needed to simulate the telephone line, i suppose a DC-source in series with a transformer would do the job. Has anyone tried this with success?

Juergen Putzger (juergen.putzger@physik.uni-regensburg.de)

941. Newbie Experience with DOVE Satellite

Newsgroup: rec.radio.amateur.space
Date: 1994-06-27 15:44:29 UTC

Newbie Experience with DOVE Satellite

I finally decided to see if I could "catch" my first satellite last week. Since DOVE is supposed to be so easy to hear, I decided that it would be my target. Everything you've heard about it is TRUE. I fired up a tracking program, determined when the next pass would be, and then turned on my ICOM handi-talkie. Right on schedule, there it was saying, "HI, THIS IS DOVE IN SPACE." Would could be easier? I thought I'd share my experience with the net just in case there are any others out there who have been wanting to try and hear a satellite first hand, but haven't ever gotten around to it.

There are plenty of other sources that describe the satellite itself in detail. Let me just say here that the frequency you are interested in is 145.825 MHz. The channel alternates between standard packet and digitized voice. The packet sessions are transmit-only (you cannot connect to the satellite) and last for 3 minutes and 10 seconds. I have included what I received during one of the transmissions at the end of this message so you can see what it looks like (anyone know how to decode the telemetry information?). After 3 minutes and 10 seconds of packet traffic, the digitized voice switches on. The voice is male and sounds pretty artificial. It says, "Hi, this is DOVE in space." It repeats this phrase 9 times, for a total of 66 seconds. It then switches back to packet and starts all over again. (I understand that this sequence is highly subject to change, but this is how it has been working for the past several days.)

The signal is quite strong. In fact, on close passes, I was able to copy the signal clearly using nothing more than a Bearcat 200XLT scanner with the stock rubber duck antenna. Using a discone antenna *inside* my attic, my ICOM 02AT was able to receive the satellite at less than 5 deg elevation and it broke the squelch at 25 deg elevation. On passes above about 40 deg elevation, it broke the squelch on a Bearcat 200XLT with a duck. I found that leaving the squelch open (off) resulted in much more copy time. (Just turn down the volume a little so the static doesn't drive you nuts!)

There isn't much Doppler shift to worry about. In fact, you could just set your radio to 145.825 and not worry about it. But, if you want to squeeze every last little peep out of a pass, I found that starting the radio on 145.830, then switching to 145.825 after about one-third of the pass, then switching to 145.820 for the last third of the pass, extended the copy time a little.

I found that generally speaking, you can copy three passes in a block. Usually the first pass is pretty low on the horizon, the second pass is a pretty good one (close to overhead), and then the third one is a pretty low pass again. I was listening to passes around noon local time as the satellite was traveling from north to south. The first pass was to the east, then overhead, and then to the west. The passes are about 90 minutes apart and an overhead pass lasts about 15 minutes.

All you need to copy the packet transmissions is a standard VHF TNC. Just remember that you do not connect to the satellite, so you need to make sure that you have your software set to monitor *all* packets the TNC receives. For those of you who don't have a amateur radio license (why not?!) and don't know what packet radio sounds like, scan between 145.010 and 145.100 MHz. That bleeeeep sound is what you are listening for from the satellite.

Get a copy of any of the satellite tracking programs and a copy of the latest elements. I used the 2-line NASA format elements that TS Kelso posts to rec.radio.amateur.misc (thanks, Dr. Kelso!). The satellite you are interested in is identified as DO-17. Determine the time of the next pass with an elevation of around 40 deg or more (for your first try), and turn on your radio. Alternatively, if you don't have access to a tracking program, you can just set your radio to 145.825 MHz with the squelch on, and wait for a pass. That's all there is to it!

Phil, KA5PVH

942. GPS group purchase shutdown

Newsgroup: rec.radio.amateur.space
Date: 1994-06-27 17:26:53 UTC
From: bonomo@specxn.enet.dec.com
Message-ID: <2un24t$4go@nntpd2.cxo.dec.com>
Source record: 27396

Greetings, all.

As I have not achieved critical mass in the number of orders for the Motorola GPS engines, I am shutting down the group purchase.

I am on vacation for the next two weeks. If, upon returning, there has not been enough orders received to reach the magic 100 mark, I will be returning the checks to those who have sent them to me, and discontinuing any efforts in this area. As of now, I have orders for about 35 units. For those of you interested, that's about $13,000 sitting on my desk.

Thanks for your time, efforts and wonderful interest in this matter.

Regards,

Tom Bonomo

MONDAY JUNE 27, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is
published every week and is made available for unlimited distribution.

* DOVE TESTING CONTINUES *
==========
At about 6/11/94 05:30 UTC controllers completed a reload of the DOVE
software and activated another voice test. The pronunciation of the word
'Hi' is a bit different and the overall amplitude of the voice is higher.

Controllers expect to continue the hardware testing process after a period
of software development on the ground that will probably last several days
to a few weeks.

The following packet frames were received from DOVE by KD2BD late last week:

DOVE-1>TIME-1 <UI>:
PHT: uptime is 014/02:11:51. Time is Fri Jun 24 16:11:31 1994

DOVE-1>BRAMST <UI>:
0500 utc 14 June 1994

Voice Module now active
Software testing continues
S-Band transmitter is off

73 DOVE Command Team (WJ9F)

Reception reports of how well the voice is heard with simple receiving
equipment (like an HT and rubber duck) would be appreciated. Please send
reports via the Internet to WJ9F, PY2BJO, WD0E, VK7ZBX, or N5AHD @amsat.org.
Telemetry is not needed at this time.

[Info via Jim White, WD0E, of the DOVE command team]

* STS-65 SAREX INFORMATION *
==========
Shuttle mission STS-65 using orbiter "Columbia" is scheduled for launch

on 08-Jul-94 at 17:06 UTC for a 14-day microgravity scientific mission. A SAREX package in configuration 'C' will be carried on Columbia on this mission. Crew members Donald A. Thomas, Mission Specialist, KC5FVF, and Robert D. Cabana, (callsign?) are among the licensed astronauts flying on mission STS-65.

The primary payload for STS-65 is the International Microgravity Laboratory (IML-02), that includes a complement of international experiments with its main focus on materials and life sciences research in microgravity. The payload crew members will perform the experiments in a "gravity gradient" stabilized attitude (shuttle tail pointed toward Earth) to maintain the best possible laboratory conditions with the least gravitational disturbances in the Spacelab.

One of the secondary payloads will be the Shuttle Amateur Radio Experiment. SAREX configuration C consists of a 2-meter handheld transceiver, I/F module, PGSC, spare battery set, window antenna, packet module, SAREX headset assembly, personal recorder, and required cable assemblies. The packet module contains a power supply and packet TNC. The power supply provides power for the TNC and the handheld transceiver. The TNC interconnects with a radio transceiver so that data to and from the computer is transmitted to and received from other amateur radio stations. Configuration C is capable of operating in either the voice or data mode in communications with amateur stations within LOS of the Orbiter. This configuration can be operated in the attended mode for voice communication and either the attended or automatic mode for data communications. The payload control weight for SAREX configuration C is 45 lb (20.41 kg).

SAREX sponsors include the American Radio Relay League (ARRL), The Radio Amateur Satellite Corporation (AMSAT), and The National Aeronautics and Space Administration (NASA). SAREX is supported by the Federal Communications Commission (FCC).

The crew will use separate receive and transmit frequencies. PLEASE DO NOT transmit on the Shuttle's downlink frequency. The SAREX frequencies for mission STS-65 are as follows:

Voice Downlink: (Worldwide) 145.55 MHz [Receive Only]
Voice Uplink: 144.91, 144.93, 144.95, 144.97, 144.99 MHz
Voice Uplink: (Europe only) 144.70, 144.75, 144.80 MHz
Packet Downlink: 145.55 MHz
Packet Uplink: 144.49 MHz

KC5FVF is the callsign that will be used for making voice contacts. W5RRR-1 will be used for packet radio connections.

QSLs and reception (SWL) reports should be sent to the ARRL EAD, STS-65 QSL, 225 Main Street, Newington, CT 06111, USA. Include the following information in your QSL or report: STS-65, date, time in UTC, frequency and mode (FM voice or packet). In addition, a large, business sized SASE must be included if you wish to receive a card in return. The Lake County Amateur Radio Club in Munster, Indiana, has generously volunteered to manage

the cards for this mission.

==============
As of 20-Jun-94, VE2TRV, has started translating SpaceNews into French for the francophone VE2-population. Mike has noted a lot of recent interest in astronomy and space-related subjects, and believes the French language version of SpaceNews will become very popular. Mike has been translating some articles from SpaceNews for the Laval Laurentian ARC newsletter, and reports the 360 members really appreciate it.

My thanks to VE2TRV for the time and effort of performing the language translation!

* RS-14 / RS-10 OBSERVATION *
============================
During a recent pass of RS-10 over the central United States, OSCAR-21's (RS-14) CW beacon (145.822 MHz) was observed through RS-10's ROBOT on 29.403 MHz at 21:36 UTC on 24-Jun-94.

Orbital analysis showed RS-10 over southern Oklahoma and heading south, while RS-14/AO-21 was over the east coast of Mexico and heading north when the beacon was heard.

Although RS-10's ROBOT input passband (centered on 145.820 MHz) is several kilohertz wide, RS-14's telemetry was heard for only a short period of time because of the high relative motion between the two spacecraft. The Doppler shift this motion produced was well in excess of the ROBOT input passband. The beacon received from RS-14 by RS-10 drifted quicky through the ROBOT passband as the two satellites passed one another over the south central United States.

* THANKS! *

944. POSAT GPS information?

Newsgroup: rec.radio.amateur.space
Date: 1994-06-28 14:07:26 UTC
From: thomsona@netcom.com
Message-ID: <thomsonaCs41wF.6y6@netcom.com>
Source record: 27398

Can anyone out there send me information on the GPS experiment
on POSAT? Equipment, experimental design and goals, results?

TIA

This is unlikely since the names that amateurs wish to call their
satellites are not the same as those assigned by NASA.

The ID numbers are the starting point. The solution is you write a
little program that processes the original 2 line file from NASA.
It includes a second file which you prepare that has the ID numbers
and the name YOU want to assign to that ID number. The output file
is a changed 2 line file with your names, sans stray spaces etc.
This is not original with me. Will Marchant, KC6ROL, did this for
a special purpose last year.

I hate to throw cold water on an idea but the 'proposal' would be
a waste of time. Neither organization is going to listen or change.

^^^^^^^^^^^^^^^

For files containing 2-line elements, try

```
grep '^[12] [0-2]' oldfile > newfile
```

Or you can use a short BASIC program:

```
OPEN "OLDFILE" FOR INPUT AS #1
OPEN "NEWFILE" FOR INPUT AS #2

WHILE NOT EOF(1)
LINE INPUT #1, A$
B$ = LTRIM$(RTRIM$(A$))

IF (LEFT$(B$,2) = "1 " OR LEFT$(B$,2) = "2 ")) AND LEN(B$) = 69 THEN
PRINT #2, B$
END IF

WEND
CLOSE
END
```

Sorry, the packet signals are Bell 202 standard, your modem is Bell 212
at 1200 baud. They aren't compatable. However, a cheap little Baycom
adapter will work with the PC.

Same here. I think it was the squint angle though. At about 1130UTC
I did manage to hear my own CW and a few other stations on the downlink
but signals were too weak for me to copy. It does seem strange that
it was not working at the beginning of the orbit. I had the beacon
at S-9 when it was already 11000 km out but nothing else was heard.
Oh well. Moving to attitude 180/0 on July 11 :-) :-) :-) :-)

Yes at the USECA clubs FD we made a few QSO's on AO-13 right as the contest began and then a few more on it's next pass closer to the end of the contest.

952. Satellite Tracking

Newsgroup: rec.radio.amateur.space
Date: 1994-06-30 08:23:36 UTC
From: niall@crystal.king.ac.uk
Message-ID: <2utve8$l2k@mercury.king.ac.uk>
Source record: 27406

This post is a follow-up to my post last week about a satellite tracking system which I am hoping to write in C for my final year project.

Thanks to the numerous people who replies with suggestions and clips of code in numerous different languages (I didn't realise how similar all these languages were - amazing how much you can relate to either C or Modula-2). Thanks also to all the people who offered to rip the guts out of their programs and send me a sysnposis (is that the right word?) of the code contained therein.

To those others who requested that I let them know what the outcome was. The answers all lie in the book "Satellite Experimenter's Handbook" by Martin Davidoff, published by the ARRL. This contains a chapter which runs through - step by step - all the formulae and computations needed to track a satellite in real time from the Kepler elements.

The book also explains everything else you could ever want to know about satellites, including specific details on each 'bird' (I might as well try and get the terminology correct).

In response to Tom <WB7ASR> who suggested that I write my program as a Windows .DLL in C++ I can only say this. What kind of nutter masochist do you think I am? I have done some windows applications programming in my time and I can imagine how hard decent graphics are to do. *imagine a sad shake of the head around here*

The good news for Tom is that the finished result WILL have rotator control - in fact that is the whole point of my project. To write a tracking system which will actually track a satellite. In fact it will track a number of them.

The project is unlikely to be finished for another nine months or so - I am just beginning now - but when it is I will be more than happy to make sources and hardware specifications available to anyone who wants them. I will post to this group when they are ready but don't hold your breath.

Thanks again to all those who helped, especially Neill Taylor <G4HLX> who sent me a PASCAL listing which did everything I wanted to do. I have never programmed in PASCAL and don't claim to understand it but his code was so well commented that it was quite easy to understand. It made a lot of murky things somewhat clearer.

Sorry for the exceptionally long post but I wanted to make sure that everyone who had helped knows how grateful I am. You all know who you are, sorry I couldn't reply individually but you wouldn't believe how much mail I got.

In my opinion the response to this request has justified my belief in both this list and in the world-wide society of Radio Amateurs in general.

Thanks,

-Niall

I was able to work 2 people in during the first 15 minutes of the
contest. Since I only needed one, I didn't listen any longer. Tough
job, huh!? Did you check the mode schedule? I noticed that a while
back somebody in Italy reported that the bird was off between 0
and 80. The official reports say it's on, but when I listened during
the week prior to FD, it didn't appear to be on until MA 80. I did hear
the beacon though...

Could it be that you were listening during the time that mode B was off?
The schedule according to the cw beacon had mode b switched off for quite
a while around perogee....This was never (to my knowledge) published in
the written schedules, but when I copied the beacon, sure 'nuff...the
command team said mode b was off around perogee.......
as for contacts, we made 80 contacts, (42 on AO-13, 33 on AO-10 and 5 on
FO-20) and we were using only cush-craft antennas......don't think that
our differences in QTH would make much difference, as we both suffered
poor squint angles and condx....maybe just unlucky timing?

[snip,snip]

I want to thank you for this informative article.
I heard DOVE today (around 11:40 am, EST) with
a simple 1/4-wave ground-plane on my HTX-202, by
following your advice to just monitor 145.825, since
I don't have any tracking prog set up yet.
I might mention that the DOVE team is interested in
reports on how well simple equipment does at receiving
the satellite - the last SpaceNews article has an
internet address for sending reception reports, although
I unfortunately didn't document my reception well enough
to say anything other than that I _could_ hear it.

Anyhow, thanks again for the neat info!

```
Archive-name: radio/rec-radio-info/welcome
Last-modified: $Date: 1994/01/02 22:00 $
Version: $Revision: 1.06 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

< Dated information here >

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat

transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us

957. Re: help-which radio?

Newsgroup: rec.radio.amateur.space
Date: 1994-07-01 12:26:22 UTC
From: "Colin R. Wright" <lifeform@delphi.com>
Message-ID: <xwyxBse.lifeform@delphi.com>
Source record: 27410

Currently, I'm using the FT-736R and have no experience with the ICOM 970A. I've only just gotten my equipment up on the satellites in the last week -- my 736R was purchased for terristrial Dxing -- but I have to say I'm very pleased with the results. I have been able to use all the SSB/FM/CW satellites I have tried (AO-10, AO-13, FO-20, AO-21, RS-12, RS-10) and have had no problems. I must add some comments about antennae, though. I originally, like you, had a desire to set up a station and invested in the Yaesu 5400 az-el rotor (which I really like) and the Cushcraft AOP-1 antenna set. I never made the first QSO with these antennas. They are currently in my garage, and have been replaced with the KLM 40CX and 22-element 2M beam. That pair of antennae, however large they may be, certainly have made all the difference in the world. The polarity switching on them can be handy, and they certainly seem to do a wonderful job for me. I hope this helps.

961. Two-Line Orbital Element Sets (TLE423)

Newsgroup: rec.radio.amateur.space
Date: 1994-07-02 13:58:56 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.773157536@afit.af.mil>
Source record: 27262

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

962. Re: help-which radio?

Newsgroup: rec.radio.amateur.space
Date: 1994-07-02 15:59:29 UTC
From: gerry@cs.tamu.edu
Message-ID: <2v42t1$o5o@news.tamu.edu>
Source record: 27263

I'm using the Icom IC-970A (not the -H!) with significant success on AO-10, AO-13, FO-20, AO-21 and AO-27. No problems, except that I'm a little underpowered sometimes. Still in all, it just works fine!

The rest of the station is the Yaesu 5400B rotor and the Cushcraft antennas (used, rebuilt and actually working). I intend to get newer and "better" antennas, but these are adequate for what I wanted initially: Get in cheap and get started (OK, so the -970 wasn't "cheap." The IC251 and -451 were, and constituted the first OSCAR station...). I'm using the Icom mast mounted preamps, although I may rework those over the next year to play with gain and noise figures somewhat.

Message-ID: <1994Jul3.141456.9078@kd4dts.atl.ga.us>
Source record: 27268

Not being familiar with any of the tracking software that's available, are there any packages that display the satellites (preferabbly a great many) orbiting with a point of view from, oh say, 20,000 miles up, and about the same out in some direction? Basically a 3D presentation of the positions?

FIELD DAY '94 A SUCCESS!

HR AMSAT NEWS SERVICE BULLETIN 184.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 2, 1994

BID: $ANS-184.01

'94 Field Day Operations Considered A Major Successs

Field Day '94, June 25-26th, proved once again that satellite stations and contacts are considered to be an important part of Field Day (FD) planning. Although only a few reports have started to trickle in, it is clear by listening to the downlink passbands that Field Day enthusiasts had more on their minds than making the one "perfunctory" contact to earn the 100 bonus points. They were on the "birds" to make points for their stations. The passbands on every OSCAR were jammed with stations calling "CQ FD." Below are some of the FD reports that have shown up on INTERNET and at AMSAT-NA HQ:

N6DD operated his FD station from his 29' long houseboat on the Colorado River 65 miles south-east of Las Vegas, NV. His yagi antennas were mounted atop his houseboat and were steered using the "armstrong" method. Although it was quite hot, about 120 degrees F (50 degrees C), and winds picking up right at AOS for some of the LEO OSCARs, N6DD was able to make 65 contacts with most of them coming from AO-10. N6DD says that he wished they had made more contacts but they were please with their satellite contacts in general. N6DD operated as class 2C NV. Next year he says that they will investigate an automatic antenna pointing system. Their station consisted of station setup KLM crossed yagis on VHF and UHF, a homebrew 2 element 10M beam on the elevation boom, a FT-736R + twin Mirages, and for 10M a Kenwood TS-130.

Field Day '94 for W0TWU was an adventure, he reports. Although he didn't expect to be operating with temperatures of 107 degrees F, it was, however, a good test to see if both the equipment and operators could survive! From Central Kansas they worked 298 stations on AO-10 and 301 stations on AO-13! They tried to work FO-20 but found they had a desense problem. Next year W0TWU says he plans to try Mode-S on FD.

N2NRD operated clase 1E from his back yard with his antennas mounted on a tripod to support his KLM-40CX & KLM-22C atenna combination. Although his "line-of-sight" was blocked at low elevations by his house, this caused only minor problems during N2NRD's FD effort. N2NRD's station equipment used: ICOM 271H/471H, KLM 40CX/22C, Kenpro 5400 antenna rotator combina-

tion, ICOM preamp, 70cm TE amp, Astron VS-50M power supply, Kenwood TS-830 and a 29MHz vertical/dipole HF antenna combination. N2NRD made over 250 contacts! One surprise of this FD was AO-10. N2NRD reports that AO-10 "was the best I have heard it in years. At apogee the signals were strong with very little fading. Perigee had AO-10 pass over-head at high elevations with very strong signals making for a good QSO run." N2NRD's plans for next year include operating the same sation setup but from a location that provieds an excellent view of horizon in all directions. Also, he plans to spend more time operating CW and get on the digital birds!

The FD satellite station at WM5U, the Lockheed Radio Club in Fort Worth, TX was part of a 2A NTX operation. Satellite availability was better than the operators of WM5U thought it would be. A new antenna setup provided them with a lot of technical problems which caused them to miss the first AO-13 window completely. The heat combined with a lack of operators made operating difficult on Saturday afternoon. But they managed a bit of a come back over the remainder of the contest period. Results were a bit disappointing because they were striving to make alest 100 QSOs. They came up a bit short with a total of 94 QSOs. WM5U made 33 CW contacts and 61 voice contacts using all the available OSCARs. Their station consisted of the following equipement: Yaesu FT-736R, a Kenwood TS-140S, Landwehr Pre-Amps, Mirage B-1016G & D-1010 power amplifiers, KLM 22C & 40CX (on a 15' Create Roof Tower) with a Yaesu G-5400B w/KC Tracker/Tuner, a DSP-12, and finally a 386SX-16 IBM PC. The operators doubt that they'll rank very well in the AMSAT competition this year but do note that it was fun anyway!

The above FD '94 reports are just a few of the summaries of from the stations that operated the OSCARs under FD conditions. But they indicate that a great deal of effort went into setting up and operating the OSCARs during FD '94. AMSAT congratulates all those who worked the birds during FD '94 and looks forward to seeing more hams on the birds in FD '95.

[The AMSAT News Service (ANS) would like to thank N6DD, W0TWU, and KG5OA for these FD '94 reports.]

STS-65 SAREX READY FOR LAUNCH!

HR AMSAT NEWS SERVICE BULLETIN 184.04 FROM AMSAT HQ
SILVER SPRING, MD JULY 2, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-184.04

STS-65 SAREX Mission Planned Launch of 08-JULY-94 Still On Schedule

The next Space Shuttle mission, with the Shuttle Amateur Radio Experiment
(SAREX) payload on-board, is currently slated for launch this Friday July 8
at 16:43 UTC. Note that this launch time is 23 minutes earlier than what has
been reported previously. The STS-65 Space Shuttle Columbia mision will
carry Amateur Radio operators Don Thomas, KC5FVF and Bob Cabana (license
pending) into a 28.5 degree inclination orbit for a 14 day mission. The
primary objective of this flight is to perform microgravity research
as part of the International Microgravity Laboratory (IML-02) mission.

Thirteen schools from the U.S., Japan, and Germany have scheduled ham radio
contacts with the astronauts. Ten of these school group contacts will be
performed using AMSAT's worldwide network of telebridge stations. The tele-
bridge allows students to talk to the Astronauts through a remote ground
station that is linked to the school though a phone bridge. The Goddard
Amateur Radio Club, WA3NAN expects to retransmit some of these school contacts
as part of their Shuttle Transmission activities. A limited number of schools
who wish to "easedrop" on the STS-65 school group contacts via a listen only
phone connection are encouraged to send e-mail to Frank Bauer, KA3HDO, with
your request. Your request should incluude an explanation of how you are going
to use this listen only dialog in your classroom setting. Mr. Bauer's e-mail
address is ka3hdo@amsat.org.

A detailed fact sheet, follows:

STS-65 Shuttle Amateur Radio Experiment (SAREX)
Information Sheet

Mission: STS-65 Space Shuttle Columbia
International Microgravity Mission (IML-02)

Launch: July 8, 1994, 16:43 UTC

Orbit: 28.45 degree inclination

Mission Length: 14 days (Nominal)

Amateur
Radio

Operators: Donald A. Thomas, KC5FVF, and Robert D. Cabana, License Pending

Modes:FM Voice
Callsign: KC5FVF

Packet Radio
Callsign: W5RRR-1

Frequencies: All operations in split mode. Do not transmit on the downlink frequency.

Voice Freqs: Downlink: 145.55 MHz (Worldwide)
Uplinks : 144.91, 144.93, 144.95, 144.97, 144.99 MHz (Except Europe)
144.70, 144.75, 144.80 MHz (Europe only)

Note: The crew will not favor any specific uplink frequency, so your ability to work the crew will be the "luck of the draw"

Packet Freqs: Downlink: 145.55 MHz
Uplink : 144.49 MHz

Info:Goddard Amateur Radio Club, WA3NAN, Greenbelt Maryland,
SAREX Bulletins and Shuttle Retransmissions
3860 KHz, 7185 KHz, 14,295 KHz, 21,395 KHz, 28,650 KHz
and 147.45 MHz (FM)

ARRL Amateur Radio Station, W1AW, Newington, CT
SAREX News Bulletins 3990, 7290, 14,290, 18,160, 21,390, and 28,590 KHz
and 147.555 MHz (FM)

Also, bulletins available on internet, via AMSAT ANS, Compuserve, and your local PBSS.

School Group Participation: 13 school groups will participate in SAREX with pre-scheduled direct and telebridge contacts. These include 11 in the U.S., and one in Germany and one in Japan.

Prelaunch Keplerian Elements:

The following represents the Keplerian Elements for a 16:43 UTC launch time. Please note that this is 17 minutes earlier that what was originally published for the launch time. Updates will be provided later in the week. These Keps are provided by Gil Carman, WA5NOM at the Johnson Space Center ARC:

>I just tried to ftp to archive.afit.af.mil to get a new set of keplerian
>elements and IT'S GONE!! "Unknown host".

This is common, especially on weekends. Just wait a few hours or days
and try again. Not to worry.

You can also get elements by telnetting (not FTP) to the raidbbs at
raidbbs.gsfc.nasa.gov Login is "raid" and password is "goddard1". You
then follow the instructions... The interface is your typical cheezy
BBS, so there is a price to pay, mainly in the time it takes to get
element sets off of it. But, on the good side, they are the most recent
elements you will find, usually a day or two fresher than on
archive.afit.af.mil

969. Sat Logging

Newsgroup: rec.radio.amateur.space
Date: 1994-07-05 22:11:53 UTC
From: koechig@garnet.msen.com
Message-ID: <2vclr9$2b6$2@heifetz.msen.com>
Source record: 27273

Just out of curiosity is there a right way and wrong way when it comes to logging satellite qsos? Is the tx freq used for the record?

Thanks

Bill Koechig, N8PKA

970. KLM vs. M2 antennas

Newsgroup: rec.radio.amateur.space
Date: 1994-07-05 23:41:52 UTC
From: Wayne_Estes@csg.mot.COM
Message-ID: <9407051841.ZM29483@SALCIUS2>
Source record: 27274

I am about to put up Oscar antennas on my roof. I have tentatively ruled out the KLM 22C antenna because the boom is so long. I would prefer to use either the small KLM's, or the M2 antennas which are 16 elements on VHF, 30 elements on UHF.

I would appreciate anybody's comments:

1. Comparison of small KLM (14 el. on VHF) vs. M2 antennas (16 el. on VHF) ? (gain, mechanical construction, weather problems, polarity relays, etc.)
2. Is a closet rod an acceptable substitute for a fiberglass crossboom ? If so, is polyurethane an acceptable sealant ?
3. Best weatherproof VHF preamp that can handle 50+ watts ?

Please respond to the newsgroup or direct to wayne@csg.mot.com

IMHO, satellite transponder passbands are small enough that logging
of the transponder mode and operating mode (ie. B/SSB, J/FM, etc.)
and the satellite is more than adequate for any logging, QSLing and
record keeping requirements. In my log and on cards under the
'FREQ' column I put the satellite name and under 'MODE' the operating
modes as above.

973. 10M receive antennas

Newsgroup: rec.radio.amateur.space
Date: 1994-07-06 18:59:08 UTC
From: Gary_Rogers@DGC.ceo.dg.COM
Message-ID: <9407061959.AI00035@rtp41.rtp.dg.com>
Source record: 27276

Message:
Well, I finally did it! Last Thursday I made my first satellite contact via RS-10. Yee-Haaa!! as they say. Other than chasing myself all over the place due to doppler and not keeping my transmissions brief, it really wasn't bad at all. After putting things off for years, I really enjoyed myself. (Those comments for any readers who have yet to actually take the plunge. Don't put it off!) One problem, though, and a question. First, the problem: I was using an R-7 for the down-link antenna, but noticed that if I switched to the 20-75 trap dipole the signal might improve. Going back and forth between antennas allowed me to keep contact. That got me to wondering, though, if some other arrangement might work better. What about crossed Yagis, fed with a 1/4 section? Maybe over a ground plane? If this arrangement has merit, what lengths and spacings would be optimal? Could I get a pattern similar to the Egg-beater I'm using on 2M? Now the question: Is the down-link from RS-10 weaker than from RS-12 or is it just my imagination? Thanks in advance.

Gary Rogers WA4YMZ E-mail: Gary Rogers@dgc.ceo.dg.com
P.S. I may work for Data General, but these opinions are my own 'cause no own else will claim them.

SAREX QSL Cards

Reports and QSLs for the upcoming Shuttle Amateur Radio EXperiment mission should be sent to ARRL EAD, STS-65 QSL, 225 Main Street, Newington, CT 06111, USA.

In order for the managing process to run smoothly, please include the following information with your report or QSL: Shuttle flight number (STS-65), date, time in UTC, frequency and mode (FM voice or packet). In addition, you must also include an SASE using a large, business-sized envelope if you wish to receive a card. No cards are distributed without the proper postage affixed or sufficient IRCs included.

Cards often take many months to produce because of printing delays and the busy schedules of the astronauts, who often help design their QSL cards. Once the cards are completed, they are forwarded to whichever Amateur Radio club is involved with the awesome task of managing the cards. The following clubs have graciously volunteered their service for handling QSL cards for the following missions:
STS-58 Connecticut DX Association
STS-60 Cowley County Amateur Radio Club, Kansas
STS-59 Orange Park Amateur Radio Club, Florida
STS-65 Lake County Amateur Radio Club, Indiana

ARLS025 New Astronaut Hams

New Astronaut Hams

Shuttle Missions To Carry New Astronaut-Hams.
Launch Scheduled for July 8.

The Amateur Radio community has three new astronaut-hams among their ranks. The FCC has recently issued call signs for Robert D. Cabana, KC5HBV, L. Blaine Hammond Jr, KC5HBS and Jerry M. Linenger, KC5HBR. Cabana will serve as Commander on the Space Shuttle Columbia which is scheduled to launch this Friday, July 8, at 1643 UTC. The mission has been designated STS-65. Hammond and Linenger will fly aboard the Shuttle Discovery during STS-64 in September.

When Columbia launches this week, it will carry the second International Microgravity Laboratory (IML-02) and the Shuttle Amateur Radio EXperiment (SAREX) payload. Cabana and Mission Specialist Donald Thomas, KC5FVF will lead the Amateur Radio activities, which will include random QSO opportunities with the general ham radio community and specially selected schools around the world.

SAREX will be flown in configuration C, which includes 2-meter FM voice and packet radio hardware. The crew will use separate receive and transmit frequencies. Earth stations should listen to the downlink frequency and transmit on the uplink frequency only when the Shuttle is in range and the astronauts are on the air. The worldwide voice and packet downlink frequency is 145.55 MHz. Please do not transmit on this frequency. The voice uplink frequencies are 144.91, 144.93, 144.95, 144.97 and 144.99 MHz. In Europe, the voice uplink frequencies are 144.70, 144.75, and 144.80 MHz. The worldwide packet uplink frequency is 144.49 MHz. Look for KC5FVF and KC5HBV on voice, and W5RRR-1 on packet which the crew may

operate in an attended or unattended mode.

The following pre-launch Keplerian elements are based upon a launch
at 1643 UTC on Friday, July 8:

From: Gary_Rogers@DGC.ceo.dg.COM
Message-ID: <9407071509.AJ00017@rtp41.rtp.dg.com>
Source record: 27281

Message:
OOPS!! In my previous posting, H-S Digest #179, I made mention of crossed Yagis. I really meant "crossed dipoles". If I had the ability to put up beams, I wouldn't have the need for a fixed antenna. I found something about this configuration in an old copy of The Satellite Experimenters Handbook with the name T/R Array (for turnstile-reflector) The diagram showed two patterns, one like a slightly elevated do-nut and the other more rounded but slightly elongated in the vertical plane with the difference being only the spacing above ground. The do-nut was 3/8 wave and the other was 1/4 wave above. Also, the antenna was illustrated for 2M, but shouldn't it work for other bands as well? Again, thanks in advance for any input.

982. Re: DOVE Confusion, Need Clarification

Newsgroup: rec.radio.amateur.space
Date: 1994-07-07 19:00:06 UTC
From: ned_stearns@email.mot.com
Message-ID: <1994Jul7.190006.6947@schbbs.mot.com>
Source record: 27285

In article <1994Jul6.233235.19336@kd4dts.atl.ga.us>, jcw@kd4dts.atl.ga.us (John C. Wren) says:
>
> I'm a little confused about the DOVE satellites (so what's new many
> people shout together...) Is DO-17 the DOVE satellite? And what
> modes, etc does it support? I'm trying to find the TLE's to add to
> PCTRACK, and I'm not sure what I'm looking for. Someone recently
> posted a large list of TLE, and the closest thing I find is DO-17.
>
> - John

Yes, DO-17 is the same satellite as DOVE. At the moment, the bird is transmitting on 145.825 +/- doppler. It is broadcasting AFSK 1200 baud packet (standard TNC will capture and decode) and computer generated voice announcements. At this time, the computer generated voice is simply saying "HI, this is DOVE in space" or something like that. A little difficult to understand. Good luck.

983. oscar rigs, etc.

Newsgroup: rec.radio.amateur.space
Date: 1994-07-07 22:40:53 UTC
From: rspear@sookit
Message-ID: <2vi09l$cda@netline-fddi.jpl.nasa.gov>
Source record: 27286

i'm trying to put together a first sat station ... right now i just use a 2 meter mobile rig, power supply and 3 element beam. i know about 726's and 736's, but i would like to enter the hobby at a less expensive level. seems that there are 2 meter and 430 mhz multimodes that were used for sat comm before the fancy newer rigs ... anyone have suggestions for entry level stuff?

regards, richard

Hi,
I am an amateur astronomer and often wondered if it was possible to identify the satellites crossing the night sky. If anyone knows, I guess you guys should know.
So, would anyone be so kind and send me the coordinates, dates, times...
I am at long.68*26, lat.+47*28.
I will appreciate very much.
Thanks.
Rachel

BID: $SPC0711

=========
SpaceNews
=========

MONDAY JULY 11, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* UNAMSAT-1 NEWS *
==================
David Liberman, XE1TU, reports that the UNAMSAT-1 spacecraft has not yet been launched. A postponment was announced through official correspondence from the Russian Space Agency just a few days before project officials had to depart for Russia, and no statement regarding the length of the delay was mentioned. It has now become apparent that the civil and military crew involved in the launch of UNAMSAT-1 are on summer vacation, possibly delaying the launch until September.

In the mean time, project officials are experimenting with the satellite on the ground, making small adjustments, and testing the satellite for all possible situations. Through this experimentation, a problem with the fire code not resetting the CPU was discovered. All the operating software has been loaded on the satellite and is running well. The BBS is being used by local amateurs with microsat ground stations.

[Info via David, XE1TU of the UNAMSAT-1 Team]

* AO-13 ATTITUDE CHANGE *
=========================
The AMSAT-OSCAR-13 satellite has undergone a recent attitude change. The following message issued by spacecraft controller G3RUH explains some of the details:

L QST de G3RUH 1994 Jul 05. Magnetorquing from attitude 243/+5 to 180/0 commences on Jul 07 [Thu] 0510 utc, orbit 4642/224, and continues for 10+ perigees. Estimated interim attitudes are: Orbit Alon/Alat: 4643 235/+4: 4645 221/-2: 4647 211/-10: 4649 205/-10: 4651 193/-12: 4653 181/-13, then a final adjustment. For command purposes during this 4-day period mode-S beacon is ON MA 140-150, i.e. mode-B OFF for 26 mins. The new schedule will start orbit 4651 MA 150 Jul 11 [Mon] 0851 utc. 73 James.

Magnetorquing (attitude changing) is not an exact science, and minor deviations from the above plan sometimes occurs.

Please don't rely on gossip and rumour! Continuous up to date information about AO-13 operations is always available on the beacons, 145.812 MHz or 2400.664 MHz in CW, RTTY and 400 bps PSK. These bulletins are also posted to Internet, ANS, Packet, PacSats etc., and many international newsletters. A 400 bps PSK decoder is available from G3RUH and several DSP products; display software P3C.EXE etc. from many AMSAT groups.

The active command stations are listed below, and constructive feedback about operations is always welcome.

Peter DB2OS @ DB0FAU.#NDS.DEU.EU
James G3RUH @ GB7DDX.#22.GBR.EU
Graham VK5AGR @ VK5WI.#ADL.#SA.AUS.OC

The above may also be reached via Internet (callsign@amsat.org) and KO-23. Please remember to state clearly a return address.

[Info via James Miller, G3RUH @ GB7DDX.#22.GBR.EU]

* LUSAT-OSCAR-19 NEWS *
=======================
The LUSAT-OSCAR-19 satellite continues to operate without its file server running. The following beacon was received from LO-19 by KD2BD in New Jersey last week:

LUSAT-1>AMARG <UI>:

May 21.

OBC crashed on May 17 at +/- 2:45 utc, lat 45s, lon 43 w.
Only digipeater is available.

LU8DYF, LO-19 command station.

Although the file server is not available, the satellite does function as a digipeater, and other ground stations can be connected to via LUSAT-1.

* DOVE DECODER AVAILABLE *
==========================
A DOVE-OSCAR-17 satellite telemetry decoding program for the MS-DOS operating system has been created by KD2BD and is now available via anonymous FTP at pilot.njin.net. The program has been compressed into a file called "duvdec10.zip", and is located in the /pub/SpaceNews/software sub-directory at pilot.njin.net.

The program will read and interpret ASCII telemetry transmissions made by DOVE-OSCAR-17 and generate reports based on that data. The software is free and is intended for non-commercial use.

* THANKS! *
===========
Thanks to all those who sent messages of appreciation to SpaceNews, especially:

GM1SXX N2SMT N2WYU VU3KNA ZR6AIU N8BMA Jay Respler

* FEEDBACK/INPUT WELCOMED *

In rec.radio.amateur.space, I wrote:

> Can anyone tell me where I can find STSORBIT via ftp?

I was able to ftp it from spacelink.msfc.nasa.gov
The filename is STS9201.ZIP

Note: the ftp server there isn't setup completely, so you won't be able
to see any files in the directory!

Thanks to Don Ryan, N2QFE for the info.

To get started with satellite communications a 25w or 50w 2m all mode
with a 3 el or 4el yagi mounted horizontal is ok for uplink to
2 satellites , RS10 and FO20. for the downlink you require
a 10m rig , i suggest an Radioshack HTX100 , they can be had for $100
this will do for the RS10 downlink using crossed horiz dipoles
and maybe a preamp for HF. Kit from Hamtronics NY $29.00.
then for FO20 downlink build an 8 el Quagi , using pine and 1/8 aluminium
rod for elements and #14 copper house wire for drive and reflector
see ARRL antenna handbook for dimensions (one eveing project) just
follow instructions. then to convert from UHF FO20 downlink to
HF 10m Hamtronics 435.5-437.5 rx converter kit $49.00. and you can
reuse your 10m preamp for this as well.
You will have to do a little work to get to FO20 however RS10 is
easy to begin sat operation.

993. KLV vs. M2 antennas

Newsgroup: rec.radio.amateur.space
Date: 1994-07-08 18:50:14 UTC
From: Wayne_Estes@csg.mot.COM
Message-ID: <9407081350.ZM10079@SALCIUS2>
Source record: 27297

Has anyone ever compared M2 antennas to the small KLM satellite antennas?
They both use 14 elements on VHF.
KLM is 22 elements on UHF, and M2 is 30 elements on UHF.

I would be particularly interested in any comments about the following:
1. gain
2. overall mechanical construction
3. performance in rain, snow, and ice
4. ease of polarity switching

Also, is a wood closet rod acceptable as a crossboom?
If so, is polyurethane an acceptable sealant?

Please respond to the newsgroup (others are interested in M2 vs. KLM comments)
or directly to wayne@csg.mot.com

Thanks, and 73,
Wayne Estes WD5FFH, Mundelein, IL

Any one have two-line elements for the moon. Mine seem to be old (not a joke). Actually, the keps I have put the moon in a slightly different position than a GPS receiver said it would be.

What is the latest version of InstanTrak? Also, how does it determine the age of a satellite from the International ID? In effect, how is the ID composed?

thanks

Apollo 11 25th Anniversary Amateur Radio Special Event Station Activity

At 1627 EDT, Sunday afternoon, July 20, 1969, astronaut Neil A. Armstrong spoke the words "Houston, Tranquility Base here. The Eagle has landed." At 2256 EDT, later the same day, Armstrong stepped down from the ladder of the Lunar Module onto the Moon's surface and spoke the words, "That's one small step for a man, one giant leap for mankind."

To commemorate that historic event twenty-five years ago next week, amateur radio clubs and groups at NASA Headquarters and the various NASA field centers will be on the air as "Special Event Stations", contacting amateur radio operators around the world.

Amateur Radio clubs or groups from twelve NASA locations are currently preparing for the 60-hour special event operating period from their respective facilities. Ham groups from other NASA locations may also be on-line to participate by the time the special event period arrives. This is the first time so many NASA stations will be represented on the air at one time. Contacts with these stations during the special event period will be confirmed on request with a certificate to commemorate man's first steps on the Moon and the special event activity.

Details:

Event Name:
Apollo 11 Moon Landing 25th Anniversary

Date/Time Period:
1700Z, July 19 through 0500Z, July 22
(1300 EDT, July 19 through 0100, July 22)

Modes:
CW, SSB, FM, Packet, Pactor, Amtor, RTTY, SSTV, ATV, Satellites.

Frequencies:
HF CW/SSB: Check 11 (as in Apollo 11) kHz up from the bottom of the General Class portion of the amateur radio bands (except 10m SSB: 28.411+ MHz).

Other Modes:
Check modes/frequencies as indicated by the individual stations below.

QSL Information:
A certificate is being designed to commemorate this special event activity, which will be individualized for each special event station.

Domestic Stations: Send a 9" x 12" self-addressed, stamped envelope to the callbook address (CBA) of the station worked or to the address

specified by the station worked. Attach $0.52 postage to cover
return mailing.

DX Stations: Send a 9" x 12" self-addressed envelope to the
appropriate address, with sufficient IRC's or U.S. Postage for return
mailing of up to 1.5 oz (42.52 grams).
Europe = $1.40US postage (3 IRC);
Mexico = $0.63US postage (2 IRC);
Canada = $0.55US (2 IRC).

Individual Station Specifics:

SB SAREX @ AMSAT $STS-65.001
SAREX Mission Status 7/8 at 23:00 EDT

Silver Spring, MD, July 8 1994 at 23:00 EDT

The Space Shuttle Columbia roared into the blue skies of the Kennedy Space Center today as the second International Microgravity Laboratory Mission (IML-02) began. The near flawless launch countdown sequence resulted in an on-time launch of the STS-65 mission at 16:43 UTC. The seven member crew of STS-65 will spend 14 days on-orbit. Two of the crew members are ham radio operators. They are Shuttle Commander Robert Cabana, KC5HBV (just licensed) and Don Thomas, KC5FVF. The two will operate the Shuttle Amateur Radio Experiment (SAREX). SAREX is a secondary mid-deck payload that allows ham radio operators and school students the opportunity to talk to the astronauts while they are in orbit. Ground based amateur radio operators can communicate with the two astronaut hams through packet radio and, when time permits, via voice contacts. Thirteen scheduled school group contacts with students in the US, Germany, and Japan are also planned.

The SAREX Working Group expects the SAREX payload to be configured and operational approximately 23 hours into the flight or at approximately 16:30 UTC on July 9. Since the launch was on time, the pre-launch Keplerian element set, JSC-004 is still valid. This element set, developed by Gil Carman, WA5NOM, is provided below for your convenience.

1001. Two-Line Orbital Element Sets (TLE426)

Newsgroup: rec.radio.amateur.space
Date: 1994-07-09 08:47:43 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.773743663@afit.af.mil>
Source record: 27303

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

```

SB SAREX @ AMSAT $STS-65.002
SAREX Status 7/10 at 1:00 UTC

Silver Spring, MD, July 10 1994 at 1:00 UTC

At approximately 22:30 into the flight of STS-65, the Shuttle Amateur Radio Experiment was set up and activated. One orbit later, as the Shuttle passed over the southern portion of the US, the Bair Middle School in Sunrise Florida had an opportunity to chat with Commander Bob Cabana, KC5HBV. During the conversation, he looked out the window and reported seeing partly cloudy weather as he passed over Florida. The Bair Middle school had an outstanding horizon-to-horizon contact. The team at the school reported that 22 students talked with Commander Cabana during their contact opportunity.

Gil Carman from the JSC ARC reports that element set JSC-004 varied from the orbit 16 state vector by 15 seconds. A new element set, JSC-005 has been generated and is provided below.

UNAMSAT-1 LAUNCH DELAYED

HR AMSAT NEWS SERVICE BULLETIN 190.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 9, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-190.01

XE1TU Reports That the UNAMSAT-1 Launch Delayed Until September '94

David Liberman (XE1TUU) reports that the UNAMSAT-1 MICROSAT launch has been postponed until early September '94. Originally, XE1TU expected to have UNAMSAT-1 launched into orbit around 15-JUNE-94 aboard a Soviet re-furbished ICBM. This latest delay came one day before XE1TU and his team were supposed to leave for Moscow. The apparent reason for the delay is due to the conflicting vacation schedules of civilian and military personel at the launch site. XE1TU recently received an official letter from Soviet officials explaining this postponement. XE1TU was encouraged by this communication because it means that launch will definitely happen now. In the meantime, UNAMSAT-1 team are working hard to "fine-tune" all the software for the satellite. Except for working some minor software issues, the Bulletin Board System (BBS) software is currently being tested "real-time" by radio amateurs in the local area. UNAMSAT-1 will have a BBS similar to AO-16, LO-19, and IO-26. Inaddition to the BBS, UNAMSAT-1 will carry a scientific payload to detect the velocity and direction of "micro-meteorites." Please stay tuned to the AMSAT News Service (ANS) bulletins for further information about the launch status of UNAMSAT-1.

[The AMSAT News Service (ANS) would like to thank David Liberman (XE1TU) for this bulletin item.]

SB SAT @ AMSAT $ANS-190.02
STS-65 SAREX MISSION BEGINS

HR AMSAT NEWS SERVICE BULLETIN 190.02 FROM AMSAT HQ
SILVER SPRING, MD JULY 9, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-190.02

STS-65 SAREX Mission Begins!

The Space Shuttle Columbia roared into the blue skies of the Kennedy Space Center on Friday, 08-JULY-94 as the second International Microgravity Laboratory Mission (IML-02) began. The near flawless launch countdown sequence resulted in an on-time launch of the STS-65 mission at 16:43 UTC.

The seven member crew of STS-65 will spend 14 days on-orbit. Two of the crew members are ham radio operators. They are Shuttle Commander Robert Cabana, (KC5HBV who was just licensed) and Don Thomas (KC5FVF). The two will operate the Shuttle Amateur Radio Experiment (SAREX). SAREX is a secondary mid-deck payload that allows ham radio operators and school students the opportunity to talk to the astronauts while they are in orbit. Ground based amateur radio operators can communicate with the two astronaut hams through packet radio and, when time permits, via voice contacts. Thirteen scheduled school group contacts with students in the US, Germany, and Japan are also planned.

At approximately 22:30 Mission Elapsed Time (MET) into the flight of STS-65, the Shuttle Amateur Radio Experiment was set up and activated. One orbit later, as the Shuttle passed over the southern portion of the US, the Bair Middle School in Sunrise Florida had an opportunity to chat with Commander Bob Cabana (KC5HBV). During the conversation, he looked out the window and reported seeing partly cloudy weather as he passed over Florida. The Bair Middle school had an outstanding "horizon-to-horizon" contact. The team at the school reported that 22 students talked with Commander Cabana during their contact opportunity.

The following is the latest keplerian element set for STS-65. Monitor the WA3NAN Shuttle re-broadcast frequencies and daily ARRL bulletins to pick up the latest element sets. The following are the frequencies for the re-broadcasts:

Goddard Amateur Radio Club, WA3NAN, Greenbelt Maryland, SAREX Bulletins and Shuttle Retransmissions 3860 KHz, 7185 KHz, 14,295 KHz, 21,395 KHz, 28,650 KHz and 147.45 MHz (FM)

ARRL Amateur Radio Station, W1AW, Newington, CT SAREX News Bulletins 3990, 7290, 14,290, 18,160, 21,390, and 28,590 KHz and 147.555 MHz (FM)

Also, bulletins available on INTERNET, via AMSAT News Service (ANS) bulletins, Compuserve, and many of our local Packet Radio BSS.

The following is a summary of the frequencies that the Shuttle astronauts will use during SAREX operations:

All operations in split mode. Do not transmit on the downlink frequency.

Voice Freqs: Downlink: 145.55 MHz (Worldwide)
Uplinks : 144.91, 144.93, 144.95, 144.97, 144.99 MHz (Except Europe)
144.70, 144.75, 144.80 MHz (Europe only)

Packet Freqs: Downlink: 145.55 MHz
Uplink : 144.49 MHz

Note: The crew will not favor any specific uplink frequency, so your ability to work the crew will be the "luck of the draw."

APOLLO 11 SPECIAL EVENT STATIONS

HR AMSAT NEWS SERVICE BULLETIN 190.03 FROM AMSAT HQ
SILVER SPRING, MD JULY 9, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-190.03

Apollo 11 25th Anniversary Amateur Radio Special Event Station Activity

At 16:27 EDT, Sunday afternoon, July 20, 1969, astronaut Neil A. Armstrong spoke the words "Houston, Tranquility Base here. The Eagle has landed." At 22:56 EDT, later the same day, Armstrong stepped down from the ladder of the Lunar Module onto the Moon's surface and spoke the words, "That's one small step for a man, one giant leap for mankind."

To commemorate that historic event twenty-five years ago next week, amateur radio clubs and groups at NASA Headquarters and the various NASA field centers will be on the air as "Special Event Stations", contacting amateur radio operators around the world.

Amateur Radio clubs or groups from twelve NASA locations are currently preparing for the 60-hour special event operating period from their respective facilities. Ham groups from other NASA locations may also be on-line to participate by the time the special event period arrives. This is the first time so many NASA stations will be represented on the air at one time. Contacts with these stations during the special event period will be confirmed on request with a certificate to commemorate man's first steps on the Moon and the special event activity.

Details:

Event Name:
Apollo 11 Moon Landing 25th Anniversary

Date/Time Period:
17:00Z, July 19 through 05:00Z, July 22
(13:00 EDT, July 19 through 01:00, July 22)

Modes:
CW, SSB, FM, Packet, Pactor, Amtor, RTTY, SSTV, ATV, Satellites.

Frequencies:
HF CW/SSB: Check 11 (as in Apollo 11) kHz up from the bottom of
the General Class portion of the amateur radio bands (except 10m SSB:
28.411+ MHz).

Other Modes:
Check modes/frequencies as indicated by the individual stations
below.

QSL Information:
A certificate is being designed to commemorate this special event
activity, which will be individualized for each special event
station.

Domestic Stations: Send a 9" x 12" self-addressed, stamped envelope
to the callbook address (CBA) of the station worked or to the address
specified by the station worked. Attach $0.52 postage to cover return
mailing.

DX Stations: Send a 9" x 12" self-addressed envelope to the
appropriate address, with sufficient IRC's or U.S. Postage for return
mailing of up to 1.5 oz (42.52 grams).
Europe = $1.40US postage (3 IRC);
Mexico = $0.63US postage (2 IRC);
Canada = $0.55US (2 IRC).

Individual Station Specifics:

SB SAT @ AMSAT $ANS-190.04
WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 190.05 FROM AMSAT HQ
SILVER SPRING, MD JULY 9, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-190.05

Weekly OSCAR Status Reports: 09-JUL-94

AO-13: Current Transponder Operating Schedule:
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 May 07-Jul 11
Mode-B : MA 0 to MA 170 |
Mode-BS : MA 170 to MA 218 |

Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-BS : MA 230 to MA 250 | Alon/Alat 230/-5
Mode-B : MA 250 to MA 256 |
Omnis : MA 250 to MA 120 | Move to attitude 180/0, Jul 11

L QST de G3RUH 1994 Jul 05. Magnetorquing from attitude 243/+5 to 180/0 commences on Jul 07 [Thu] 05:10 UTC, Orbit #4642/224, and continues for 10+ perigees. Estimated interim attitudes are: Orbit Alon/Alat: 4643 235/+4: 4645 221/-2: 4647 211/-10: 4649 205/-10: 4651 193/-12: 4653 181/-13, then a final adjustment. For command purposes during this 4-day period Mode-S beacon is ON MA 140-150, i.e. Mode-B OFF for 26 mins. The new schedule will start orbit 4651 MA 150 Jul 11 [Mon] 08:51 UTC. Magnetorquing (attitude changing) is not an exact science, and minor deviations from the above plan sometimes occurs. Please don't rely on gossip and rumor! Continuous up-to-date information about AO-13 operations is always available on the beacons, 145.812 MHz or 2400.664 MHz in CW, RTTY and 400 bps PSK. These bulletins are also posted to Internet, ANS, Packet, PacSats etc., and many international newsletters. A 400 bps PSK decoder is available from G3RUH and several DSP products; display software P3C.EXE etc. from many AMSAT groups. The active command stations are listed below, and constructive feedback about operations is always welcome.

Peter DB2OS @ DB0FAU.#NDS.DEU.EU
James G3RUH @ GB7DDX.#22.GBR.EU
Graham VK5AGR @ VK5WI.#ADL.#SA.AUS.OC
The above may also be reached via Internet (callsign@amsat.org) and KO-23. Please remember to state clearly a return address.
[G3RUH/DB2OS/VK5AGR]

MIR: The new Soyuz flight has the following 2 cosmonauts boarding Mir as Crew #16: Yurij Malenchenko (R0MIR) & Talgat Musabaeyv (R0MIR). They will be joining Valerij Polyakov (U3MIR) who is attempting to break the manned space flight endurance record. The call signs for the new cosmonauts (R0MIR) are generic for the Mir, so don't be surprised if the call sign should change in the near future. The crew that will be leaving Mir is Viktor Afanasiev (U9MIR) and Yurij Usachev (R3MIR). This information comes from Serge Samburov, Space "MIR" QSL Manager Chief of Cosmonaut Amateur Radio Department NPO "Energia." All Mir contact QSLs should be sent directly to Serge at: P.O. Box 73, Kaliningrad-10 city, Moscow Area, 141070, RUSSIA.
[N2WWD]

DO-17: DO-17 still continues to transmit its voice message on a downlink frequency of 145.825 MHz.

KO-25: There have been several reports showing up on the KO-25 BBS that apparently the NASA 2-line elements are not correct. It seems that they are the elements of a satellite that is within close proximity of KO-25. This problem was first noted by W5RKN and after posting a message to the BBS of KO-25 several operators replied that they also have noted the same problem. All KO-25 users are asked to

keep monitoring this problem while inquiries are being made are
made about correcting the keps for KO-25. [W5RKN]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ N0QCU. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

SB SAREX @ AMSAT $STS-65.003
SAREX Status 7/11 at 2:30 UTC

Silver Spring, MD, July 11 1994 at 2:30 UTC

The Shuttle Amateur Radio Experiment (SAREX) packet robot was activated today. Several stationsmade packet connects immediately after activation. At present, at least 84 packet connects have been confirmed. The SAREX packet callsign is W5RRR-1. The uplink frequency is 144.49 MHz and the downlink is 145.55 MHz.

At 2/1:33 MET (18:16 UTC) the Sacred Hearts Academy in Honolulu, Hawaii had a 4 minute school group pass with the Space Shuttle Columbia. 8 students talked to STS-65 Mission Commander Bob Cabana, KC5HBV.

The official element set for today is JSC-006. This element set was provided courtesy of Gil Carman, WA5NOM, from the JSC ARC.

1013. GARC Shuttle Communications Retransmissions

Newsgroup: rec.radio.amateur.space
Date: 1994-07-11 11:13:35 UTC
From: Erich Franz Stocker <stocker@spsosun.gsfc.nasa.gov>
Message-ID: <2vr9gv$eo8@paperboy.gsfc.nasa.gov>
Source record: 27317
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.misc

INTERESTED IN STS-65 SHUTTLE TRANSMISSIONS
The Goddard Amateur Radio Club (GARC) invites interested people to tune
in to
STS-65 shuttle ground communications transmissions. As a public service
to the
Amateur radio community, the GARC retransmits space shuttle air-to-ground
communications. During the STS-65 mission which also carries a Shuttle
Amateur Radio Experiment (SAREX), Amateur radio operators, shortwave
listeners,
and individuals with scanners can listen to these communications on the
following HF (single sideband) and VHF (FM) frequencies:

3.860 MHz (lower sideband)
7.186 MHz (lower sideband)
14.295 MHz (upper sideband)
21.395 MHz (upper sideband)
28.650 MHz (upper sideband)
147.45 MHz (FM) in local Washington D.C. metro area

As previous posts have indicated STS-65 also carries SAREX.

Packet Radio
Callsign: W5RRR-1

Freqs: All operations in split mode. Do NOT transmit
on the downlink frequency.

Voice Freqs: Downlink: 145.55 MHz (worldwide)
Uplinks: 144.91,144.95,144.97,144.99 MHz

Crew will not favor any specific frequency

Packet Freq: Downlink: 145.55 MHz
Uplink: 144.49 MHz

1014. Re: Sat Logging

Newsgroup: rec.radio.amateur.space
Date: 1994-07-11 12:14:03 UTC
From: "Colin R. Wright" <lifeform@delphi.com>
Message-ID: <R8wTK+L.lifeform@delphi.com>
Source record: 27318

I usually just log the frequency as "AO-10/B" or "FO-20/JA" and then keep the mode as it would normally be (SSB, FM, etc.). This makes it nice for computer logging, as I can search the frequency field for a "/" and find all my satellite contacts easily.

1015. SAREX Rise/Set Times 7/11

SB SAREX @ AMSAT $STS-65.004
STS-65 Eastern R/S Times 07/11

Below are the rise and set times for STS-65 for selected US cities
over the next four days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note that
the times shown are UTC and NOT LOCAL TIME. This listing includes only
those passes with an elevation greater than 5 degrees. For information
regarding SAREX frequencies and operations procedures, check your
local PBBS, or bulletins from W1AW, W5RRR, W6VIO or WA3NAN.

Symbol key: rise = time that shuttle appears above horizon
tca = time of closest approach to observer
set = time that shuttle disappears below horizon
el = maximium elevation above horizon
geo = geometry: A = Ascending orbit, moving south to north
D = Descending orbit, moving north to south
E = passes east of observer
W = passes west of observer

SB SAREX @ AMSAT $STS-65.006
STS-65 Western R/S Times 07/11

Below are the rise and set times for STS-65 for selected US cities
over the next four days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note that
the times shown are UTC and NOT LOCAL TIME. This listing includes only
those passes with an elevation greater than 5 degrees. For information
regarding SAREX frequencies and operations procedures, check your
local PBBS, or bulletins from W1AW, W5RRR, W6VIO or WA3NAN.

Symbol key: rise = time that shuttle appears above horizon
tca = time of closest approach to observer
set = time that shuttle disappears below horizon
el = maximium elevation above horizon
geo = geometry: A = Ascending orbit, moving south to north
D = Descending orbit, moving north to south
E = passes east of observer
W = passes west of observer

1016. DOVE Telemetry Decoding Software

Newsgroup: rec.radio.amateur.space
Date: 1994-07-11 14:34:23 UTC
From: jcw@kd4dts.atl.ga.us
Message-ID: <1994Jul11.143423.1710@kd4dts.atl.ga.us>
Source record: 27325

I'm looking for some good software for decoding the telemetry
from DOVE. I'd like something that I can both connect to a
TNC, and feed it a file from a terminal program running in
capture mode. I've got the one that was posted to ftp.funet.fi
(DOVE3W13) but I'm not overly impressed.

If anyone has any suggestions for something better, or a program
that can handle the telemetry from other satellites, I'd like
to know about it, please.

1017. Internet Offers Space Station Petition

Newsgroup: rec.radio.amateur.space
Date: 1994-07-11 18:43:40 UTC
From: ssa@SEDS.LPL.Arizona.EDU
Message-ID: <2vs3ss$a0k@news.CCIT.Arizona.EDU>
Source record: 27320

Dear Colleague:

Student Space Action would like to inform you of a way in which you can directly voice your support for manned space exploration. As you read this, your space program is in danger of becoming extinct. Congress is once again attempting to eliminate space station funding. Cancellation of the space station could mean the phase-out of space exploration and eventual termination of aerospace industries and job opportunities. The resulting impact on the nation's economy, technology and educational system would be disastrous.

You can tell your congressmen exactly how much you support the space station and the manned space initiative by signing the Student Space Action's Interactive Online Petition. Simply follow these steps:

telnet seds.lpl.arizona.edu
login> space

Now answer the questions to the best of your ability
(read the directions accompanying the petition--
use <tab> to enter answer; <enter> to toggle yes/no;
up/down arrows to go backwards and forwards through
questions. Caution: if floating characters appear on
your screen--ignore--it's probably just an emulation
problem. Your petition will still be signed.

After you submit the petition, you will receive information
on your congressmen and senators so you can contact them further
by phone or mail if you desire.

The petition is also accessible by NCSA Mosaic. Simply go to the following
URL and follow the directions:

URL: http://seds.lpl.arizona.edu/ssa/petition.html

Answer the questions and submit the petition and you
will receive the same information as the telnet version.
You will also have the option of linking to the space
station home page where you can read up-to-date information
on the space station, including issues of "Space Station
This Week."

Please forward this message to anyone you may feel would want to be a part
of this effort--everyone!

If you believe the space program is a vital part of our country's future,
both in economic growth and technological advancement, then sign the

Student Space Action's Interactive Petition.

If you believe that NASA should remain as an engine for continued manned space exploration, then tell everyone you know to sign this petition.

If you believe that our government, by supporting an initiative like the space station, is making an investment in the future generation of this great nation, then send your message to Washington by signing the Student Space Action Interactive Petition.

SPACE STATION: IT'S ABOUT LIFE ON EARTH!!

Your voice does count! And it WILL make a difference!

Sincerely,

--

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

I have been thinking about what it would take to put together a portable 9600 baud satellite station? After all, the satellite is a cube about 9" on a side, can we put together something about that size?

My idea is to have a radio, tnc, antenna, and laptop computer that could be powered from a battery and used anywhere. I thought I would pose a few questions to the net to gather up some suggestions from those with 9600 baud pacsat experience. I don't know if I will really put this together, but it is interesting to think about. I am posting this to both bbs@amsat.org and rec.radio.amateur.space groups.

RADIO:
First thought is to use one of the newer dual banders that come ready for 9600 packet. These have the new jack on the back that connects the TNC to the proper stages within the radio to support 9600 baud. One of the problems that I see with these radios is the IF bandwidth to allow for Doppler shift of +/- apx 10KHz. Most of these radios tune in 5KHz steps. So do we have a problem with tuning needed to track Doppler with this style of radio? Also, the cost of these radios is rather high.

Another idea is to use an older 25 watt 2 meter radio for the uplink. This radio would need to be modified to drive the vco from the TNC. These are pretty cheap. For the downlink, could a simple scanner work? Bruce, N4USH, posted a message about using a Radio Shack Pro 2006 scanner to receive downlinks. I have modified a scanner for APT fax use by changing out the IF filter with a filter of wider bandwidth. Bruce used the search mode of the scanner to change to a new frequency to follow the sat's Doppler change. The system would also probably require a preamp to help out the receiver. Comments on using this setup for the radios?

TNC:
There seems to be many 9600 baud G3RUH compatible TNCs on the market. I have seen the ads for AEA, DRSI, and others. The DRSI looks interesting as it draws only 40mA. Also, using a TNC that supports normal 1200 baud allows connection to common PBBS and users. Are any of these TNCs better or easier to use than others?

ANTENNA:
Couple of ideas here. A couple of quarter wave ground planes could be used. I see that several of the antenna manufacturers sell 144/440 4/5 element beams using a common boom. MFJ sells one for around $40. One of these could be mounted to a camera tripod and hand tracked during the pass. The beamwidth of these short beams is wide, which helps to simplify tracking of the satellite. The antenna needs to be easy to assemble and disassemble to allow for easy transport.

COMPUTER:
A portable of probably at least 386SX power with hard disk would be needed to run PB, PG and a tracking program. What is the minimum computer needed? The tracking program could generate an AZ/EL list before the pass and either print a list (if printer available) or the user could write these numbers down. Then during to pass the operator hand tracks the satellite and lets PB or PG run. Being more of a Mac person, can PB & PG run under Soft PC on a Mac portable?

BATTERY:
A gel cell could be used to power everything. Probably something in the 12 AH range would be needed. A solar panel could be used to charge the battery between passes. A power cord to connect the system into a carUs cigarette lighter would also be useful.

So, it seems that it is possible to build a portable 9600 baud satellite station that would fit inside a camera bag or brief case. Has anyone put together such a package? Any other comments about this portable idea?

I'll compile a list of all the responses that I receive. If there is interest I'll post the responses.

Thanks,

Randy

SB SPACE ARL ARLS026
ARLS026 NASA operations detailed

NASA operations detailed

At least 12 amateur stations associated with the National Aeronautics and Space Administration will be active July 19 to 22 to commemorate the 25th anniversary of humans landing on the moon, on July 20, 1969, on Apollo 11. The operations will begin at 0700 UTC July 19 and end at 0500 UTC July 22, coinciding with the time the Apollo Moon Lander (the Eagle) was on the moon's surface in 1969.

Stations are expected to be on modes including CW, SSB, FM, packet, Pactor, Amtor, RTTY, SSTV, ATV, and amateur satellites. Here are the 12 stations expected to be active:

Ames Amateur Radio Club, NASA Ames Research Center, Moffett Field, California: K6MF (AARC, Box 73, Moffett Field CA 94035-1000).

Dryden Amateur Radio Club, NASA Dryden Flight Research Center, Edwards, California: KF7GD (NASA DFRC, Attn: Dryden ARC, POB 273, Edwards CA 93523).

Goddard Amateur Radio Club, NASA Goddard Space Flight Center, Greenbelt MD: WA3NAN (GARC, PO Box 86, Greenbelt, MD 20768-0086).

Guam Contingency Landing Site Amateur Radio Group: KC4YDP/KH2 (NASA RADIO, Kennedy Space Center FL 32899).

NASA Headquarters Amateur Radio Group, Washington, DC: N4ZR (2003 Sarazen Place, Reston VA 22091-3809).

Jet Propulsion Laboratory Amateur Radio Club and Goldstone Amateur Radio Club, Jet Propulsion Laboratory, Pasadena, California: W6VIO (JPLARC, M/S 168-327, 4800 Oak Grove Dr, Pasadena, CA 91109).

Johnson Space Center Amateur Radio Club, NASA Johnson Space Center, Houston, TX: W5RRR (JSC ARC/W5RRR, Johnson Space Center, Houston TX 77058).

Kennedy Space Center Amateur Radio Group, Kennedy Space Center, Florida: KC4TCV (NASA RADIO, Kennedy Space Center FL 32899).

NASA Lewis Amateur Radio Club (NLARC), NASA Lewis Research Center, Cleveland, Ohio: AK8Y (NASA Lewis Amateur Radio Club, 21000 Brookpark Rd, MS 54-6, Cleveland OH 44135).

Marshall Amateur Radio Club, NASA Marshall Space Flight Center, Huntsville, Alabama: WA4NZD (Marshall Amateur Radio Club, CM21X, MSFC AL 35812).

Stennis Space Center Amateur Radio Club, NASA Stennis Space Center, Mississippi: K5GY (Stennis Space Center Amateur Radio Club, Bldg 1201, Stennis Space Center MS 39529).

Wallops Island Amateur Radio Club, NASA Wallops Flight Facility, Wallops Island, Virginia: KE3ND (Wallops Island ARC, NASA Wallops Flight Facility, Building E-134, Wallops Island VA 23337).

White Sands Complex Amateur Radio Group, NASA White Sands Test Facility, Las Cruces, New Mexico: KF7E (P.O. Box 627, Organ NM 88052).

There are numerous sets of two-line elements available through FTP; also freeware and shareware for computing viewing times and look angles. Suggest you surf through some of Ted Kelso's articles posted here, and to sci.space.news, sci.space.astro, and sci.space.science.

Since I'm kind of new to the sattelite tracking world I am trying to find out more about the sattelites which are listed in the two line Nasa data and Amsat 2L data. I can load these up and do all of the niffty things that Orbitrack does but most the time I haven't a clue as to what the sattelite does or who it belongs to. Does anyone know about any publications, listings out there that can shed some light on this subject?

[some deleted]

I felt I just had to say this. I'm listening right now to 3860 kHz and I
hear more jabber from the guy at the radio club than the retransmissions
from the shuttle. I've noticed this trend over past shuttle missions as well
that the radio club talks an awful lot. Some of the information is quite
useful but at the expense of the primary purpose for the station.
I don't know how you could solve this problem unless you used another freq for
your bulletins, maybe up 10 kHz, and announced that on the retransmission
freq before you speak, or have a regular schedule for these transmission
on the alternate freq. I hope you don't think I'm griping too much because I
can't thank the people there enough for this service. When our link here isn't
working or I go on a trip, you are always there.

Just my $0.02.

The big KLMs are so much better than anything else that I'd make every
effort to fit them on the roof rather than accept a smaller compromise.
They *can* be made to work on a chimney mount.

> If so, is polyurethane an acceptable sealant ?

Yes, you can use a wooden crossboom, and yes poly is a good sealant.
However, the fiberglass crossboom will be better over the long term.
Again, don't stint on your antennas for satellite.

>3. Best weatherproof VHF preamp that can handle 50+ watts ?

SSB Electronics.

>level stuff?

Yes, any of the Icom Twin sets are fine. The IC211 and IC251 need the
Mutek front end board fitted for best results. Since Mutek doesn't make
those anymore, that could be a tough problem. I've got a IC211 with the
Mutek board that blew the doors off most of the more modern rigs before
lightning got it. Even without the Mutek board, a strong preamp can
bring these radios alive. If you have a HF rig, take the IF out signal
from the back and run it into the HF rig. Then you can use the narrow
filters in the HF rig. Note, that uses the 2m rig as a tunable transverter.

Another alternative is to actually *use* a transverter. The Microwave
Modules units are functional, but hard to find since they went out
of production. The SSB Electronics transverters are wonderful, but
you'll pay as much for one of those as for a modern multimode. If you
are adventuresome, you might try to find the IC202 and IC402 portable
SSB rigs. They are VXO controlled, and use a considerably older technology,
but they do work.

For the cheapest of the cheap, if you have a HF receiver, you can use
a Hamtronics converter in front of it for 2m receive, and use a surplus
commercial FM transmitter strip as a CW transmitter on 435 MHz. That's
a really cheap way to get about 100 watts of RF at 70cm.

Myles,

During shuttle missions such as this one, there is a large amount of the
"retransmission" time in which no earth-to-ground transmissions are taking
place. As in the previous missions in which a mid-deck and payload bay
module were being used and very few problems were being encountered, when
there is no transmission, the GSFC retransmission frequencies are quiet
and subject to someone else moving in on the frequency (try listening
on 14.295 or 7185 some time). The poeple working at WA3NAN do a great job
of bringing us the missions, and almost always are aware of when there
is someone talking either to the shuttle or the ground. In this case, I
have heard the GSFC group stop transmitting (even in the midst of reading
an element set) until the shuttle transmission was finished.

Unfortunately, not all hams are aware (and some ARE, but don't care), of
the shuttle retransmissions, and frequently transmit close enough to QRM
WA3NAN. It seems to make sense to me that, during quiet times from the
shuttle, the folks at Goddard transmit in order to let others know that
the frequency is occupied. Again, during a mission such as this, those
quiet times are many. Perhaps we might suggest some things that we are
interested in knowing about during shuttle missions that WA3NAN could
transmit during these quiet times. I'm sure they would like to give us

information other than crew biographies over and over. Maybe they could
give background on what type of science is being done on a particular mission.

Just another perspective,

Dave

Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

This is a copy of an article "6500hage@ucsbuxa.ucsb.edu (William F. Hagen)" wrote "20 Apr 92 06:54:52 GMT", hope this will help you ...

5 VANGUARD 1: The second USA satellite (after Explorer 1) and the oldest satellite still in orbit from any nation. Vanguard 1 is very faint visually, between tenth and fifteenth magnitude depending on its distance and illuminaton.

16 VANGUARD 1 ROCKET/BODY: The oldest RB in orbit, and with the Vanguard 1 payload, the oldest object still in orbit from any nation. The Vanguard RB is much brighter than its payload, sometimes as bright as seventh magnitude on very favorable passes.

20 VANGUARD 3: This satellite was never separated from its rocket/body, so it is unusually bright for the early payloads still in orbit. At perigee it can reach sixth magnitude, although it spends most of its time at much higher altitudes.

47 TRANSIT 2-A ROCKET/BODY: From the 1960 launch of an early Transit navigation satellite.

59 COURIER 1-B ROCKET/BODY: This is the rocket/body from the launch of the very early low-orbit Courier 1-B communications satellite. Launched in October 1960, three years to the day after Sputnik 1, there are only 22 objects (counting payloads, R/Bs and debris) that have been in orbit longer than NORAD catalog number 59. And at a reliable sixth magnitude this satellite is an easy object to spot in binoculars.

424 ALOUETTE 1: An eigth magnitude Canadian satellite that investigated the ionosphere. This is the oldest non-USA satellite in Earth orbit, older than any Soviet satellite in Earth orbit. There are two older Soviet spacecraft in heliocentric orbit.

426 ALOUETTE 1 ROCKET/BODY: A fifth magnitude Agena-B rocket/body from Thor-Agena TA-1, launched in September 1962 from Vandenberg. The payload was Alouette 1, a Canadian satellite that investigated the ionosphere.

694 CENTAUR 2: This is the first Centaur rocket ever to enter space, on the Atlas/Centaur 2 rocket launched in November 1963 from pad 36-A at the Cape Canaveral Air Force Station. A/C-1 failed due to an Atlas malfunction. Centaur 2 was an engineering test for the Centaur program, under development for the Surveyor lunar landing probes. Visually Centaur 2 is a very interesting satellite. It is tumbling with a period of 20 seconds, with a three magnitude swing from maximum to minimum. It is also in a very eccentric orbit, ranging from 500 to 1,500 kilometers, which makes Centaur 2 appear very different depending on its altitude. At perigee it ranges from first to fourth magnitude every 20 seconds, and at apogee the swing is between fourth

and seventh magnitude. Centaur 2 is the most easily seen satellite launched before the mid-60s. This is one of the three Centaurs in low orbit.

727 SOLRAD 7A / SECOR 1 ROCKET/BODY: A multiple-payload fifth magnitude rocket/body, probably an Agena. The payloads were the scientific satellites Solrad 7A and Greb, the store/dump LEO comsat Secor 1, and Gravity Gradient 1.

741 ECHO 2 ROCKET/BODY: This is the Agena upper stage from the Thor-Agena TA-2 rocket that boosted the famous Echo 2 balloon satellite into a 1,000 kilometer high orbit from Vandenberg in January 1964. Echo 2 was a 135-foot diameter mylar balloon that served as a passive line-of-sight communications relay, and brilliant visual satellite, until its decay in June 1969 due to a combination of solar radiation pressure and atmospheric drag. The R/B is about sixth magnitude, still in the precise orbit that the brilliant Echo 2 once followed (the R/B has a much higher density and was unaffected by solar radiation pressure), today only and echo of Echo.

1245 SOLRAD 7B / SECOR 3 ROCKET/BODY: A multiple-payload fifth magnitude rocket/body, probably an Agena. The payloads were the scientific satellites Solrad 7B and Greb, the store/dump LEO comsat Secor 3, Gravity Gradient satellites 2 and 3, Surcal, and the amateur radio satellite Oscar 3.

1807 ALOUETTE 2 ROCKET/BODY: The Agena rocket/body from the dual launch of Alouette 2 and Explorer 31. The R/B has a wide magnitude range and a period of 40 seconds.

2142 OAO 1: Orbiting Astronomical Observatory 1 failed after two days in orbit due to a battery failure. OAO 1 has been reported as bright as magnitude -1 during one flare, although it is typically closer to fifth magnitude. All three OAOs have had flashes into the negative magnitudes, probably due to the highly reflective telescopic mirrors.

2144 OAO 1 ROCKET/BODY: Agena-B rocket/body from the launch of Orbiting Astronomical Observatory 1 in April 1966. In the fifth magnitude range.

2174 NIMBUS 2 ROCKET/BODY: Agena TA-6 rocket/body from the 1966 launch of a Nimbus polar weather satellite aboard a Thor-Agena rocket. In a sun-synchronous orbit with evening passes near sixth magnitude.

2255 PAGEOS ROCKET/BODY: Agena TA-7 rocket/body from the launch of the Pageos mylar balloon. In a 4,000 kilometer high orbit, the R/B is quite faint near ninth magnitude. It has been reported to have a flash period of 18.6 seconds.

2826 TIMATION 1 ROCKET/BODY: From launch of a navigation satellite.

3597 OAO 2: Orbiting Astronomical Observatory 2 was launched on Atlas/Centaur 16 in December 1968. OAO 2 ran a very successful ultraviolet astronomy program. All three OAOs have been reported to flash into the negative magnitudes on occasion, probably due to their highly reflective telescopic mirrors.

3598 OAO 2 ROCKET/BODY: Centaur stage from Atlas/Centaur 16, launched in December 1968 from pad 36-B at the Cape Canaveral Air Force Station. The payload was the astronomical telescope Orbiting Astronomical Observatory 2.

OAO 2 R/B is a very easily seen, if somewhat visually unpredictable, satellite. It is generally in the third magnitude range, but it is sometimes up to three magnitudes off prediction in either direction. This is one of the three Centaurs in low orbit.

4159 TIMATION 2 ROCKET/BODY: From launch of a navigation satellite.

4327 SERT 2 (Space Electric Rocket Test): This was an engineering test for ion propulsion in space. The ion engine fired a one-ounce thrust for eight months, but the engines shut down before their design lifetime and the mission was officially considered unsuccessful.

4392 MAO 1 ROCKET/BODY: The RB from the first Chinese launch, of the 'East is Red' satellite, in April 1970.

4786 COSMOS 382: This is by far the largest piece from the Cosmos 382 satellite, which apparently made some separations during its operational lifetime. C-382 was an engineering test for the 1971 Soviet missions to Mars, which included the first soft landing ever made on that planet. Unfortunately the 1971 spacecraft fleet arrived during a major dust storm that obscured the planet's surface from view and made conditions on the surface inhospitable to the Soviet lander, which went silent seconds after touchdown. C-382 is a rather large satellite in a fairly high orbit, making it relatively easy to locate visually. It has been reported to have a flash period of under five seconds.

4794 NOAA 1 ROCKET/BODY: Delta rocket/body from the launch of the NOAA 1 polar weather satellite in December 1970 from Vandenberg. Sun-synchronous orbit, flash period reported of 3.5 seconds.

4966 COSMOS 398: This satellite, close to re-entry, is thought to have been an engineering test related to the Soviet manned lunar landing program.

5994 PAGEOS DA: This is one of the two large pieces of the Pageos balloon satellite still in orbit. Pageos is a 100-foot diameter mylar ballon, nearly identical to the Echo satellites, launched into a very high polar orbit from Vandenberg. Pageos' orbital altitude was initially near 4,000 kilometers, but the satellite was still second magnitude despite the very great distance. This combination of great altitude and great size made Pageos one of the most interesting visual satellites ever launched. Due to its great surface area and low mass, Pageos was subjected to intense solar sailing due to the radiation pressure of sunlight. In 1975 Pageos broke up in orbit, possibly due to weakening from micrometeoroid impacts, into about 75 pieces. Only five remain in orbit, and only two of these are large pieces (5994 and 8074). These two satellites are still active solar sailers. Solar radiation pressure has, over time, made the orbits of 5994 and 8074 very elliptical. Their perigees are under 1,000 kilometers, and their apogees are nearly 7,000 kilometers. Since they have very low densities, their perigee altitudes are dangerously low and they will probably re-enter within the next few years. This is the same fate that brought down the similar Echo balloons -- solar sailing down the perigee, and atmospheric drag finishing the job. Both 5994 and 8074 are quite bright and easily seen objects, normally seen in

intermediate altitudes near fourth to sixth magnitude. Due to their large surface area and irregular shape their brightness can be unpredictable. 5994 was mistakenly catalogued by NORAD as one of the Westford Needles deployed from the Midas 6 satellite, which were in a similar orbit to Pageos, but it is clearly a Pageos fragment.

6126 LANDSAT 1: USA earth resources satellite. For information on the Landsat program, see 14780.

6153 COPERNICUS (OAO 3): The third Orbiting Astronomical Observatory, renamed Copernicus in orbit, was launched on Atlas/Centaur 22 in August 1972 from pad 36-B. It ran a very successful ultraviolet and X-ray astronomy program. Visually Copernicus is one of the most interesting satellites in orbit. It has a complex light curve that repeats every minute. It will be very faint, in the seventh magnitude range, and slowly increase brightness over almost a minute to third magnitude. Then it will rapidly increase brightness and flash in the magnitude zero to -2 range. The magnitude drop after the flash is very rapid as it sinks back to seventh magnitude. All three OAOs have flashed into the negative magnitudes, although Copernicus is the only one to do so regularly. These flashes are probably caused by their very reflective telescopic mirrors. Despite its brilliant flashes Copernicus can be a difficult satellite to observe because it is nearly invisible at minimum.

6155 COPERNICUS (OAO 3) ROCKET/BODY: Centaur stage from Atlas/Centaur 22, launched in August 1972 from pad 36-B at the Cape Canaveral Air Force Station. Copernicus R/B is fairly easily seen, typically near third magnitude, but its brightness is somewhat unpredictable like 3598. This is one of the three Centaurs in low orbit.

7228 MIRANDA ROCKET/BODY: The Scout solid-fuel upper stage from the launch of the British experimental satellite Miranda. In the seventh to eigth magnitude range.

7615 LANDSAT 2: USA earth resources satellite. For information on the Landsat program see 14780.

7902 INTELSAT 4-1 ROCKET/BODY: Information on the Intelsat-4 rocket/body series is very similar to the Intelsat 4-A rocket/body series; see 8331.

7646 STARLETTE: French geodetic satellite, 25 centimeters diameter, passive laser reflector. Probably not a good candidate for visual observation.

7946 NIMBUS 6 ROCKET/BODY: Delta upper stage from the 1975 launch of a Nimbus weather satellite. In a sun-synchronous orbit with evening passes near fifth magnitude.

8074 PAGEOS H: Large fragment of the Pageos balloon. See 5994 for details.

8331 INTELSAT 4A-1 ROCKET/BODY: Centaur stage from the launch of an Intelsat 4A international communications satellite. The Centaur stages in Geosynchronous Transfer Orbit (GTO) have bright repeating glints that can be seen in binoculars at fairly high altitudes. The perigee altitudes of the five Intelsat 4A, seven Intelsat 4 and four Comstar rocket/bodies are high

enough to avoid significant atmospheric drag; the three Intelsat 5 and the FltSatCom 4 rocket/bodies have a very low perigee that makes their positions somewhat uncertain. These GTO Centaur objects have a very unique appearance, due to their size, tumble and eccentric orbit, that make them interesting satellites to observe.

8709 UME 1: Japanese ionospheric sounding satellite also known as ISS-A. Flash period of 3.5 seconds.

8710 UME 1 ROCKET/BODY: Japanese N-1 rocket/body from launch of Ume-1.

8820 LAGEOS: (Laser Geodynamics Satellite) A 900-pound sphere with a diameter of 2 feet, Lageos is in a very high altitude very highly stable orbit for precise geodetic mapping. The satellite is a passive reflector for laser beams. Because of its small size and great altitude, Lageos is certainly not visible to amateur trackers.

8840 COMSTAR 1 ROCKET/BODY: Information on the Comstar rocket/body series is very similar to the Intelsat 4A rocket/body series; see 8331.

8897 COSMOS 825-832 ROCKET/BODY: Flash period of 30 seconds

9598 COSMOS 871-878 ROCKET/BODY: Soviet R/B in a 1,500 kilometer high orbit, very sharp glints every 4.17 seconds.

10293 COSMOS 939-946 ROCKET/BODY: Flash period of 31.8 seconds

10295 SIRIO ROCKET/BODY: Delta upper stage from the launch of the Italian communications satellite Sirio-1 (translation to Sirius)

10517 SAKURA ROCKET/BODY: Delta upper stage from the launch of the Japanese experimental geostationary communications satellite Sakura-1

10674 UME 2: Japanese ionospheric sounding satellite also known as ISS-B.

10675 UME 2 ROCKET/BODY: Japanese N-1 rocket/body from launch of Ume-2, flash period of 2.7 seconds.

10702 LANDSAT 3: USA earth resources satellite. For information on the Landsat series see 14780.

10793 YURI ROCKET/BODY: Delta upper stage from the launch of the Japanese experimental direct-broadcast communications satellite Yuri-1

10954 GOES 3 ROCKET/BODY: Delta upper stage from the launch of the GOES-6 geostationary civilian weather satellite.

10967 SEASAT: This polar-orbiting and slightly retrograde satellite was launched from Vandenberg to study the oceans. The solar arrays are mounted on the Agena upper stage, which was maintained as part of the Seasat structure. It came to a premature failure after a few months in orbit, partly due to errors made in the ground operation of the spacecraft. Despite its short life it produced a great deal of valuable data on the oceans and on the capabilities of synthetic aperature radar orbital mapping, a technique later used on the Magellan Venus orbiter and the Lacrosse spy satellite. Visually

Seasat is around third magnitude, although it can get as bright as zero magnitude on rare passes.

11080 NIMBUS 7: USA civilian weather satellite in sun-synchronous orbit. Passes near noon and midnight. Visually can be seen over the pole near the summer solstice.

11136 COSMOS 1051-1058 ROCKET/BODY: Flash period of 6.82 seconds

11266 COSMOS 1076: Soviet oceanographic satellite

11286 INTERCOSMOS 19 ROCKET/BODY: Soviet R/B, tumbler, with a 40 second period. Maximum can be in the second magnitude range.

11546 COSMOS 1130-1137 ROCKET/BODY: Flash period of 15.47 seconds

11671 COSMOS 1151: Soviet oceanographic satellite, flash rate of five seconds

11751 COSMOS 1171 ROCKET/BODY: Flash period of 25.8 seconds

12069 FLTSATCOM 4 ROCKET/BODY: Centaur stage from AC-57 launch of military comsat. Flash period of 5.15 seconds; the glints are fairly bright, rising a couple of magnitudes above the predicted brightness.

12497 INTELSAT 5-1 ROCKET/BODY: Centaur stage from AC-56 launch of an international communications satellite. Flash period of five seconds.

12553 NOAA 7: This polar-orbiting weather satellite is now tumbling, and has frequent glints as bright as second magnitude on favorable passes. The flash pattern is very regular and predictable. NOAA 7 is in a sun-synchronous orbit that has seasonal visibility windows. Because of the brightness of the glints it is often visible at low elevations, making it possible to see the satellite even in seasons when there are no favorable passes.

12887 SME: Solar Mesosphere Explorer science satellite studies atmosphere, sunlight and their interaction. Flash period of 2 seconds.

12889 SME ROCKET/BODY: Delta rocket/body from launch of Solar Mesospheric Explorer and amateur radio satellite Uosat Oscar-9.

12983 COSMOS 1320-1327 ROCKET/BODY: Flash period of 14.9 seconds

13007 INTELSAT 5-3 ROCKET/BODY: Centaur stage from AC-55 launch of an international communications satellite. Flash period of 4.7 seconds.

13923 NOAA 8: USA civilian weather satellite, no longer operational

13367 LANDSAT 4: USA earth resources satellite. For information on the Landsat program see 14780.

13777 IRAS (InfraRed Astronomical Satellite): IRAS, the best infrared telescope ever launched, is one of the most famous satellites in orbit. It eventually ceased operation when the liquid helium used to cool the telescope evaporated from solar warming. IRAS is a joint USA, UK and Netherlands project, and was launced on a Delta rocket from the Vandenberg Air Force Base in California. Visually IRAS is typically in the fifth magnitude range, but

it can sometimes flare up to second magnitude. It is in a sun-synchronous orbit so its visibility is seasonal. From my latitude (28 N) IRAS is best seen in the evening sky in the winter months.

13778 IRAS ROCKET/BODY: The Delta rocket/body from the launch of IRAS.

13985 SATCOM 6 ROCKET/BODY: Delta rocket/body from the launch of the Satcom-F1R communications satellite

14051 GOES 6 ROCKET/BODY: Delta upper stage from the launch of the GOES-6 geostationary civilian weather satellite

14096 EXOSAT ROCKET/BODY: Delta rocket/body from the launch of the European X-Ray Observation Satellite

14179 COSMOS 1473-1480 ROCKET/BODY: Flash period of 43.5 seconds

14372 COSMOS 1500: Soviet oceanographic satellite

14612 COSMOS 1522-1529 ROCKET/BODY: Flash period of 39.14 seconds

14693 PALAPA 4 ROCKET/BODY and 14694 WESTAR 6 ROCKET/BODY: Two PAM upper stages that were intended to boost their commercial communications satellite payloads into geostationary orbit. They were launched aboard the space shuttle Challenger and deployed into an identical parking orbit, but idential malfunctions stranded the satellites in low orbit. The payloads were recovered on a later shuttle mission and relaunched in 1990 aboard unmanned launch vehicles, but the failed PAM stages remain in low orbit, where they can be visually seen in the third to sixth magnitude range depending on altitude. This provides a unique opportunity for the observation of a PAM stage at close range.

14780 LANDSAT 5: Fifth in the USA series of earth resources satellites. Also known as ERTS (Earth Resources Technology Satellites). The Landsat series is the primary civilian USA source for global imaging of the Earth's surface. Landsat images can show the current land use and the potential natural resources. Landsats 1-3 are near sixth magnitude, and the more advanced 4 and 5 satellites are near fourth magnitude.

15202 AMPTE ROCKET/BODY: Delta upper stage from the launch of three satellites forming the Active Magnetosphere Particle Tracer Explorer constellation. The three satellites (CCE [USA], IRM [West German] and UKS [UK]) were boosted beyond the Delta's parking orbit into very highly eccentric orbits for the study of the magnetosphere. The Ampte RB ranges from fourth to eigth magnitude depending on altitude.

15244 LEASAT 2 ROCKET/BODY: Leasat 2 was launched aboard the space shuttle Discovery in August 1984 on mission STS 41-D. For generic information on the Leasat RBs, see 20411.

15331 COSMOS 1602: Soviet oceanographic satellite.

15333 COSMOS 1603: Soviet Electronic Intellegence (ELINT) satellite. Made a dramatic series of orbital manoevers after launch, changing both altitude and

orbital plane.

15354 ERBS (Earth Radiation Budget Satellite): ERBS was launched aboard the space shuttle Challenger (mission STS 41-G) in October 1984. Its mission is to study the Earth's radiation budget, i.e. the solar energy recieved and the reradiated energy from Earth. ERBS compliments similar experiments flown on several polar-orbiting NOAA weather satellites. Visually ERBS is in the fifth magnitude range.

15390 LEASAT 1 ROCKET/BODY: Leasat 1 was launched aboard the space shuttle Discovery in November 1984 on mission STS 51-A. For generic information on the Leasat RBs, see 20411.

15427 NOAA 9: USA civilian weather satellite in low polar sun-synch orbit.

15516 METEOR 2-12: Soviet weather satellite. Visually near sixth magnitude.

15595 GEOSAT: USA Geodynamic Earth and Oceans Satellite.

15625 COSMOS 1635-1642 ROCKET/BODY: Flash period of 40.25 seconds

16001 LEASAT 4 ROCKET/BODY: Leasat 4 was launched aboard the space shuttle Discovery in August 1985 on mission STS 51-I. For generic information on the Leasat RBs, see 20411.

16181 COSMOS 1697: Soviet Electronic Intellegence (ELINT) satellite.

16182 COSMOS 1697 ROCKET/BODY: Soviet SL-16 Zenit booster from launch of ELINT satellite. For generic Zenit information see 20625.

16191 METEOR 3-1: Soviet weather satellite. Visually sixth-seventh magnitude.

16229 LEASAT 3 ROCKET/BODY: Leasat 3 was launched aboard the space shuttle Discovery in April 1985 aboard mission STS 51-D. Due to a malfunction on the satellite the upper stage that became 16229 was never commanded to ignite, and the Leasat was stranded in a low orbit until a later shuttle rescue repaired the problem. A solar reflector was installed on the upper stage to try to warm the solid fuel. After several months in drift mode the booster was ignited and the Leasat entered the intended orbit. For generic information on the Leasat RBs, see 20411.

16408 METEOR 2-13: Soviet weather satellite. Visually near sixth magnitude.

16609 MIR COMPLEX: This is mankind's only operational space station. The Soviet complex consists of the Mir core, two Kvant modules, and one Kristall module, all launched separately and docked in orbit. Cosmonauts are launched to the Mir complex and return to Earth aboard Soyuz spacecraft. When manned the Mir includes the crew's Soyuz craft. The normal Mir crew size is two, although it is typically five for a short time when the old crew hands over to the new crew. There are frequent launches of unmanned Progress cargo supply spacecraft to Mir when manned, and there is normally one Progress docked to the complex. The primary purposes of the Mir are life-sciences experiments to determine the effect of long-duration weightless conditions on the human body

and 'microgravity' commercial industrial experiments. Visually Mir is in the zero magnitude range and is easily the brightest artificial satellite in orbit. Because of frequent manoevering to compensate for atmospheric drag, and occasional major orbital changes during rendezvous with Soyuz and Progress spacecraft, Mir will often be much earlier or later than predicted by satellite tracking software.

16728 COSMOS 1745 ROCKET/BODY: Flash period of 11.02 seconds

16908 EGP/AJISAI: This Japanese satellite is the most distinctive object in orbit. EGP (Experimental Geodetic Payload), also known as EGS (Experimental Geodetic Satellite) or Ajisai (Hydrangea flower), was launched on the first test flight of the H-1 rocket in August 1986. EGP is a sphere with a diameter of seven feet, and is covered with mirrors and corner-cube reflectors. The latter are used to reflect laser beams and are invisible to amateur observers, but the mirrors are spectacular. They are designed to reflect sunlight so the satellite can be photographed by ground stations for precise geodetic surveying measurements. The glints are probably in the third magnitude range but are visible to the naked eye only in very dark skies under good conditions. The brief flashes are too short to be noticed by the naked eye. In binoculars EGP resembles the strobe of an airplane but the flash pattern is more complex than a strobe light. Because of the extremely high orbital altitude of 1,500 kilometers, EGP is often visible closer to midnight than other satellites, and can frequently be seen on as many as four orbits during a single overnight observing session.

16910 EGP ROCKET/BODY: Upper stage from the H-1 rocket that launched the EGP satellite and a small amateur radio secondary payload Fuji 1 / Oscar 12 (FO-12). The R/B is quite large and, therefore, bright (fifth magnitude) for its altitude of 1,500 kilometers. It does not appear to be tumbling and is fairly constant in its brightness.

16969 NOAA 10: Active USA civilian weather satellite in low polar sun-synch orbit. Passes near sunrise and sunset, sometimes visible in evening skies near sixth magnitude. APT radio transmissions can be recieved on 137.500 MHz.

17070 POLAR BEAR: USA NNSS navigation satellite with auroral studies. Was restored from display at the Smithsonian in Washington, DC.

17146 COSMOS 1794-1801 ROCKET/BODY: Flash period of 19 seconds

17480 ASTRO 3: Japanese X-ray astronomy satellite, also known as 'Ginga'.

17527 MOS 1-A: Japanese Maritime Observation Satellite

17589 COSMOS 1833: Soviet Electronic Intellegence (ELINT) satellite

17590 COSMOS 1833 ROCKET/BODY: Soviet SL-16 Zenit booster from launch of ELINT satellite. For generic Zenit information see 20625.

17973 COSMOS 1844: Soviet Electronic Intellegence (ELINT) satellite

17974 COSMOS 1844 ROCKET/BODY: Soviet SL-16 Zenit booster from launch of ELINT satellite. For generic Zenit information see 20625.

18121 COSMOS 1852-1859 ROCKET/BODY: Flash period of 40 seconds

18123 DMSP 2-3: Military weather satellite. For general information on the DMSP series see 20978.

18129 COSMOS 1861: Soviet system-1 navigation satellite. Carries RS/10-11 amateur radio package onboard. Visually near sixth magnitude.

18312 METEOR 2-16: Soviet weather satellite. Visually near sixth magnitude.

18313 METEOR 2-16 ROCKET/BODY: Soviet Tsyklon (Cyclone) rocket/body.

18665 COSMOS 1900: This is the nuclear reactor from the Cosmos 1900 naval reconnoisance satellite. The satellites, which operate in very low orbits, are supposed to jettison their nuclear reactors into a higher stable orbit at the end of their operational mission. Twice the separation systems failed resulting in the re-entry of the nuclear fuel, once into the NWT in Canada, and once into the Indian Ocean. C-1900 failed in orbit and came very close to re-entering before the separation and boost systems activated, keeping the 110 pounds of uranium in orbit as the rest of the spacecraft plunged to Earth. The C-1900 satellite is about fourth magnitude and has a flash period of 10 seconds.

18820 METEOR 2-17: Soviet weather satellite. Visually near sixth magnitude.

18821 METEOR 2-17 ROCKET/BODY: Soviet Tsyklon (Cyclone) rocket/body.

18822 DMSP 2-4: Military weather satellite. For general information on the DMSP series see 20978.

18945 COSMOS 1924-1931 ROCKET/BODY: Flash period of 20.1 seconds

18986 COSMOS 1934 ROCKET/BODY: Flash period of 16.8 seconds

19119 COSMOS 1943: Soviet Electronic Intellegence (ELINT) satellite

19120 COSMOS 1943 ROCKET/BODY: Soviet SL-16 Zenit booster from launch of ELINT satellite. Visually, a tumbler with a period of 20 seconds. For generic Zenit information see 20625.

19257 COSMOS 1954 ROCKET/BODY: Flash period of 48 seconds

19274 OKEAN 1: Soviet oceanographic satellite

19336 METEOR 3-2: Soviet weather satellite. Visually sixth-seventh magnitude.

19467 FENG YUN 1-A: Chinese weather satellite in low polar sun-synch orbit

19531 NOAA 11: Active USA civilian weather satellite in low polar sun-synch orbit. Passes near noon and midnight, sometimes visible over the pole in summer near sixth magnitude. APT radio transmissions can be recieved on 137.650 MHz.

19649 COSMOS 1980: Soviet Electronic Intellegence (ELINT) satellite

19650 COSMOS 1980 ROCKET/BODY: Soviet SL-16 Zenit booster from launch of ELINT satellite. Visually, a tumbler with a period of 40 seconds. For generic Zenit information see 20625.

19671 LACROSSE 1: This 'dark' Department of Defense satellite is actually ruby red. The first Lacrosse satellite was launched aboard the space shuttle Atlantis (mission STS-27) in December 1988 from launch pad 39-B at the Kennedy Space Center. Lacrosse is a radar imaging satellite similar to the Magellan Venus orbiter, but with a much higher resolution. It is considered one of the most important USA military spacecraft. Lacrosse was, at one time, known by the code name Indigo. Visually Lacrosse is, after EGP, the most distinctive satellite in orbit. It is very bright, second magnitude, and a very strong shade of red. At that magnitude the eye can easily see color making the effect even more obvious. Lacrosse is also in the rather high orbit of 670 kilometers, at least high for something so large, so that the combination of color, brightness and apparent speed make it instantly recognizable. Because it is a classified satellite there are no NORAD orbital elements available, but it is quite easy to keep track of the satellite without official help. Its red color was seen while still in Atlantis' cargo bay on mission 27, and it was seen one orbit later after deployment as a red satellite co-orbital with the shuttle. Since that time it has been 'lost' for only a very short period of time, just after launch. Lacrosse is one of the most interesting satellites to observe.

19826 COSMOS 2004: Soviet System-2 navigation satellite

19827 COSMOS 2004 ROCKET/BODY: From launch of navigation satellite. Tumbler, with a flash period of 40.6 seconds.

19851 METEOR 2-18: Soviet weather satellite. Visually near sixth magnitude.

19910 COSMOS 2008-2015 ROCKET/BODY: Tumbler, flash period of 6.35 seconds

19911 DELTA STAR: This is a 'gray' Department of Defense satellite which NORAD releases orbital data on. It is a research and development satellite for the Strategic Defense Initiative, better known as Star Wars. The name is derived from its Delta launch vehicle.

19921 COSMOS 2016: Soviet System-2 navigaton satellite

19922 COSMOS 2016 ROCKET/BODY: From launch of navigation satellite. Tumbler, with a flash period of 17.2 seconds.

20045 COSMOS 2026: Soviet System-2 navigation satellite

20046 COSMOS 2026 ROCKET/BODY: From launch of navigation satellite. Tumbler, with a flash period of 23 seconds.

20064 COSMOS 2027: Soviet Electronic Intellegence (ELINT) satellite

20103 NADEZHDA 1: Soviet navigation satellite. The satellite is named (translation=Hope) for an onboard COSPAS/SARSAT package that locates emergency beacons.

20149 COSMOS 2034: Soviet system-2 navigation satellite

20150 COSMOS 2034 ROCKET/BODY: From launch of navigation satellite. Tumbler, with a lighthouse appearance, flash period of 4.7 seconds.

20197 COSMOS 2037 ROCKET/BODY: From launch of Soviet geodetic satellite. Tumbler, flash period of 0.8 seconds.

20259 COSMOS 2046: Soviet Electronic Ocean Reconnaissance Satellite (EORSAT); very bright first-magnitude satellite.

20261 INTERCOSMOS 24: Joint Soviet / eastern block scientific satellite to study the magnetosphere and the propogation of low radio frequencies.

20262 INTERCOSMOS 24 ROCKET/BODY: Soviet Tsyklon (Cyclone) third stage rocket/body from launch of Intercosmos 24 and Magion subsatellite.

20303 GPS 2-4 ROCKET/BODY: Delta-II second stage from launch of fourth block-2 GPS-Navstar navigation satellite. The GPS (Global Positioning System) series is a USA Department of Defense constellation of navigation satellites in circular 12-hour orbits. The primary use of GPS is for military navigation, but civilian users are allowed limited use of the satellites. The block-2 GPS-Navstar satellites are launched on the new Delta-II rocket. The second stage from the Delta remains in an eccentric parking orbit near 400x1000 km for some launches, depending on the payload's destination orbital plane. On some launches the parking orbit perigee is much lower and the second stage quickly decays. Visually the GPS RBs are fairly predictable in brightness, in the third to sixth magnitude range depending on altitude and solar illumination. They do not appear to be tumbling and maintain a steady brightness during a pass. The second stage is actually blue-green, and carries the GPS, McDonnell Douglas and USAF logos, but any color is very hard to detect in orbit.

20305 METEOR 3-3: Soviet weather satellite. Visually sixth-seventh magnitude.

20322 COBE (COsmic Background Explorer): COBE's mission is to explore the residual background radiation from the big bang. It has measured the smoothness of the background and shown that the early universe was homogenous to a degree beyond the measuring capability of any previous instrument. COBE was launched on a Delta rocket from Vandenberg Air Force Base in California. Visually COBE is a rather erratic satellite, often in the fourth magnitude range, but under certain lighting conditions it will be near first magnitude. These changes seem unrelated to the illumination phase. When it is bright its magnitude cycles between about first and third magnitude as COBE spins. Under most conditions COBE's spin does not appear to create a light curve. COBE is in a sun-synchronous orbit.

20362 GPS 2-5 ROCKET/BODY: Delta-II second stage from the launch of the fifth block-2 GPS-Navstar navigation satellite in December 1989 from the Cape Canaveral Air Force Station. For general information on GPS RBs see 20303.

20406 JCSAT 2 ROCKET/BODY: The modified Minuteman-III third stage, similar to the Leasat RBs, used as an upper stage for the Japanese communications satellite JCSAT. Launched from CCAFS pad 40 aboard the first commercial Titan rocket on new year's eve 1989.

20411 LEASAT 5 ROCKET/BODY: The Leasat R/Bs are modified Minuteman-III third stages used as a perigee kick motor for the Leasat (also known as Syncom) communications satellites. Leasat 5 was launched in January 1990 aboard the space shuttle Columbia on mission STS-32, a flight that included the recovery of the LDEF satellite. Visually the R/B has a firefly appearance in the fourth magnitude range at perigee. The Leasat RBs are in eccentric GTO orbits and are only good visual targets when close to perigee.

20432 COSMOS 2056: Soviet store/dump communications satellite

20433 COSMOS 2056 ROCKET/BODY: From launch of store/dump comsat. Flash period of 4.1 seconds.

20436 SPOT 2: European commercial earth resources satellite in polar sun-synch orbit; launched on Ariane rocket

20443 SPOT 2 ROCKET/BODY: Ariane rocket/body from launch of Spot 2 earth resources satellite and six small amateur radio satellites.

20453 GPS 2-6 ROCKET/BODY: Delta-II second stage from the launch of sixth block-2 GPS-Navstar navigation satellite from the Cape Canaveral Air Force Station. GPS 2-6 was launched just after sunset on January 24, 1990, and broke into daylight during ascent. For general information on GPS RBs see 20303.

20465 COSMOS 2058: Soviet Electronic Intellegence (ELINT) satellite

20478 MOS 1-B: Japanese Maritime Observation Satellite

20479 ORIZURU (DEBUT): Japanese Deployable Boom and Umbrella Test. Technology development satellite.

20491 MOS 1-B ROCKET/BODY: Japanese H-1 rocket/body from launch of MOS 1-B, Orizuru and a small Fuji amateur radio satellite

20496 LACE: USA Laser Atmospheric Compensation Experiment launched on Delta rocket with RME. A star wars test satellite for development of laser technology. Visually in the fourth magnitude range with a slightly reddish hue.

20497 RME: USA Relay Mirror Experiment launched on Delta with LACE. Carries a 2-foot diameter mirror for star wars testing.

20508 NADEZHDA 2: Soviet navigation satellite. The satellite is named (translation=Hope) for an onboard COSPAS/SARSAT package that locates emergency beacons.

20509 NADEZHDA 2 ROCKET/BODY: Tumbler with a flash period of 20.5 seconds

20510 OKEAN 2: Soviet oceanographic satellite

20523 INTELSAT 6-3: This international communications satellite was left stranded in low orbit when its booster, the second Commercial Titan rocket (similar to the Titan-III), failed to separate the satellite from the second stage. The Titan/Intelsat combination was in a very low parking orbit so the only way to save the payload was to order spacecraft separation from the

Intelsat's third stage perigee kick motor. The Titan second stage refused all commands to separate from the third stage, which is not part of the Titan launch vehicle and is considered to be payload at that stage in the launch process. The Intelsat was separated from the third stage and moved into a higher parking orbit where it can compensate for atmospheric drag by using its onboard manoevering fuel. The burned-out Titan second stage, and the Intelsat's third stage which was still firmly bolted to the Titan, re-entered 14 days after launch. Intelsat 6-3 is awaiting a shuttle rescue, presently scheduled for the first flight of the new orbiter Endeavour in 1992. The shuttle will carry a new third stage to Intelsat and place it on the satellite so that it will reach its operational geostationary orbit. Until it is rescued, satellite observers have a very rare opportunity to see a geosynch communications satellite at close range -- some 60 times closer, and nine magnitudes brighter, than its intended orbit. Intelsat 6 satellites are spin stabilized, and Intelsat 6-3 goes through a very noticeable light curve from most perspectives. Its theoretical magnitude is third, but it is more often either brighter or fainter than predicted. From some angles it goes through some very bright glints. It normally gives only three or four flashes before its orbital motion takes it away from that angle. If the satellite is observed on the following days, it will almost always produce a similar series of flases in the same part of the sky.

20525 COSMOS 2060: Soviet Electronic Ocean Reconnaissance Satellite (EORSAT); very bright first-magnitude satellite.

20527 COSMOS 2061: Soviet system-2 navigation satellite

20528 COSMOS 2061 ROCKET/BODY: From launch of navigation satellite. Flash period of 17.9 seconds.

20546 PEGSAT: This is the rocket/body, with an attached payload, from the first orbital rocket ever launched from the air. The privately developed Pegasus booster is dropped from a B-52 over the Pacific Ocean and then fires itself into orbit. A chemical release payload is attached to the spent rocket casing, and a small Department of Defense GLOMR satellite was deployed into a separate orbit. Pegsat is visually an interesting satellite, with a very large magnitude range from maximum to minimum, and a 2-second period to complete an entire cycle. Pegsat is in a sun-synchronous orbit.

20557 COSMOS 2064-2071 ROCKET/BODY: Flash period 12.4 seconds.

20571 PALAPA 6 ROCKET/BODY: Delta second-stage from the relaunch of the Indian Palapa satellite stranded (see 14693) and recovered by the shuttle.

20577 COSMOS 2074: Soviet system-2 navigation satellite

20580 HUBBLE SPACE TELESCOPE (HST): HST was launched aboard the space shuttle Discovery (mission STS-31) in April 1990 from launch pad 39-B at the Kennedy Space Center. HST is mankind's best optical telescope despite the serious spherical abberation that has left it unable to achieve its theoretical capabilities. HST is scheduled to be revisted by the shuttle several times during its 15-year orbital life. The purpose of these visits, planned long before the spherical abberation was discovered, are to boost HST's orbit and

replace the scientific instruments with more advanced designs. HST has no onboard propellant at all and is purely ballistic; it does not have the ability to boost its orbit periodically to compensate for atmospheric drag. The reason for this is that any residual propellants in HST's orbit could damage its optical instruments. HST must be revisited by the shuttle every few years to reboost it to its original altitude of over 600 kilometers; otherwise it will be destroyed on reentry, as happened to Skylab and Solar Max, and could have happened to LDEF. It has been expected that better instruments could be built for HST during its 15-year lifetime, so NASA planned to make use of the revisit missions to swap some of the scientific experiments while the shuttle was there. This capability will be utilized to partially 'fix' HST on the first revisit mission by replacing the primary camera with a replacement that will compensate for the spherical abberation. Visually HST is rarely fainter than third magnitude on favorable passes, and is more frequently in the first magnitude range. Each of the two solar panels is as large as the telescope itself, and these are held perpendicular to the Sun, so the illumination phase of HST is very important in predicting its brightness. When HST is seen at a high phase (in the east after sunset or the west before sunrise) there are sometimes very brilliant glints off the solar panels, sometimes as bright as magnitude -4. HST's orbital inclination of 28 degrees means it never passes directly over most of the United States, but it can be seen in binoculars even at elevations of 10 degrees, so it can be seen by ambitious observers in very northern latitudes.

20582 COSMOS 2075 ROCKET/BODY: Flash period of 4 seconds

20624 COSMOS 2082: Soviet Electronic Intellegence (ELINT) satellite

20625 COSMOS 2082 ROCKET/BODY: This SL-16 Zenit rocket boosted a Soviet ELINT spacecraft. The R/B is a very rapid tumbler, with a flash period of 1.3 seconds, and slowing due to interaction with the magnetic field. The Zenit boosters are among the largest objects in orbit and easily naked-eye, often close to second magnitude at maximum.

20638 ROSAT: The Rosat (Roentgen Satellite) is a German X-ray telescope launched on a Delta-II rocket from the Cape Canaveral Air Force Station in June 1990. Rosat is the most advanced X-ray telescope ever launched. It was initially planned for a shuttle launch and the reconfiguration to an unmanned launch vehicle delayed its flight by several years. There is significant American and British involvement in Rosat. Visually Rosat has a very strong yellow-gold hue because of the insulation that covers almost all of the spacecraft. It is typically in the fourth magnitude range but has been seen as bright as first magnitude.

20639 ROSAT ROCKET/BODY: Delta second-stage from launch of Rosat

20663 COSMOS 2084: This is a Soviet satellite intended for a Molniya orbit which was left stranded in a 600-kilometer altitude orbit due to a booster failure (see 20664). C-2084 is believed to be an early-warning military spacecraft. Observers of this satellite have a unique opportunity to observe a Molniya-orbit satellite at close range. Visually it is in the fourth magnitude range.

20664 COSMOS 2084 ROCKET/BODY: This is the fourth stage perigee kick motor that was to have boosted Cosmos 2084 from its parking orbit into a Molniya orbit. It apparently shut down shortly after ignition and then separated from the payload, leaving it in a useless but stable low orbit. As with the payload, observers have here a unique opportunity to observe the upper stage at close range. Visually it is a tumbling object, easily naked-eye at maximum.

20670 METEOR 2-19: Soviet weather satellite. Visually near sixth magnitude.

20683 GAMMA: Large Soviet gamma-ray astronomical telescope. Second magnitude satellite.

20712 CRRES: Joint NASA/USAF Combined Release and Radiation Effects Satellite. The NASA program is a series of chemical releases of Barium and Lithium into the magnetosphere; the unclassified USAF program is research and development testing of new materials and electronic parts to determine the effects of the space environment for future spacecraft design.

20775 COSMOS 2098 ROCKET/BODY: Flash period of 2.3 seconds

20788 FENG YUN 1-B: Chinese weather satellite in low polar sun-synch orbit

20789 ATMOSPHERE 1 and 20790 ATMOSPHERE 2: These are two passive balloons launched by China as piggyback payloads on the Feng Yun 1-B rocket in September 1990. The satellites are about 10 feet in diameter. Their mission is to measure the density of the upper atmosphere at orbital altitudes by observing the air's drag effect on their orbits. Atmosphere 1 is near re-entry, but Atmosphere 2 is still safely in orbit. The two are in the fourth magnitude range and starting to show unstable brightnesses as the balloons start to deform.

20791 FENG YUN 1-B ROCKET/BODY: This Chinese booster exploded in orbit, well after deploying the Feng Yun 1-B weather satellite and two small balloon secondary payloads. None of the payloads were damaged by the explosion, which produced about 75 pieces of debris large enough to be tracked by NORAD. The largest piece of the R/B, 20791, now has a very complex light curve. This is visually one of the most interesting satellites in orbit. The flash period, that is, the time for the brightness variations to repeat, has been measured at three seconds. Some of the glints can get fairly bright when seen from a good perspective.

20843 ULYSSES ROCKET/BODY: The IUS (Intertial Upper Stage) first-stage from the launch of the Ulysses interplanetary spacecraft, en route to Jupiter for a gravity assisted plane change to enter the intended polar heliocentric orbit for study of the Sun's magnetic field. 20843 has remained in Earth orbit, in GTO, and is an interesting historic object to sight at perigee. Ulysses was launched in October 1990 aboard the space shuttle Discovery on mission STS-41.

20919 INMARSAT 2-1 ROCKET/BODY: Delta-II second stage from the launch of the first dedicated Inmarsat communications satellite (previous Inmarsat payloads have piggybacked on other comsats). The launch vehicle was the 200th Delta rocket.

20960 GPS 2-10 ROCKET/BODY: Delta-II second stage from the launch of the tenth block-2 GPS-Navstar navigation satellite from the Cape Canaveral Air Force Station. This was the first flight of a Delta with the uprated larger solid boosters, and the increased payload capacity was partly used to reduce the inclination of the parking orbit to 21 degrees. For general information on GPS RBs see 20303.

20978 DMSP 2-5: Military weather satellite (Defense Meteorology Support Program). The DMSP satellites are in low polar sun-synch orbits and similar in size to the civilian NOAA weather satellites. Their orbits are not classified. Visually DMSP satellites are in the sixth magnitude range.

SB SAREX @ AMSAT $STS-65.008
SAREX Keps 7/13 at 10:00 UTC

Silver Spring. MD 7/13 at 10:00 UTC

At this time, the official Orbital element set for the STS-65 Space Shuttle
Mission is set GSFC-014. This set was generated by Ron Parise, WA4SIR at
the Goddard Space Flight Center.

STS-65
1 23173U 94039A 94193.26085228 0.00002036 00000-0 47272-5 0 146
2 23173 28.4704 341.0586 0002767 343.5572 16.4949 15.90437602 584

Satellite: STS-65
Catalog number: 23173
Epoch time: 94193.26085228 (12 JUL 94 06:15:37.64 UTC)
Element set: GSFC-014
Inclination: 28.4704 deg
RA of node: 341.0586 deg Space Shuttle Flight STS-65
Eccentricity: 0.0002767 Keplerian Elements
Arg of perigee: 343.5572 deg
Mean anomaly: 16.4949 deg
Mean motion: 15.90437602 rev/day Semi-major Axis: 6679.1896 Km
Decay rate: 0.20E-04 rev/day*2 Apogee Alt: 302.65 Km
Epoch rev: 58 Perigee Alt: 298.95 Km

NOTE - This element set is based on NORAD element set # 014.
The spacecraft has been propagated to the next ascending
node, and the orbit number has been adjusted to bring it
into agreement with the NASA numbering convention.

Peter, Armstrong maintains that he said 'a' and that it was lost in the noise of the transmission. Listening to the tape, how will we ever know?

M2 makes a long 2 meter antenna that is, IMHO, far superior to the KLM -22C.
Designed by the smae person, Mike Staal (K6MYC) years later, the M2
antenna is more robust in construction.

Apollo 11 25th Anniversary Amateur Radio Special Event Station Activity

At 1627 EDT, Sunday afternoon, July 20, 1969, astronaut Neil A. Armstrong spoke the words "Houston, Tranquility Base here. The Eagle has landed." At 2256 EDT, later the same day, Armstrong stepped down from the ladder of the Lunar Module onto the Moon's surface and spoke the words, "That's one small step for a man, one giant leap for mankind."

To commemorate that historic event twenty-five years ago next week, amateur radio clubs and groups at NASA Headquarters and the various NASA field centers will be on the air as "Special Event Stations", contacting amateur radio operators around the world.

Amateur Radio clubs or groups from twelve NASA locations are currently preparing for the 60-hour special event operating period from their respective facilities. Ham groups from other NASA locations may also be on-line to participate by the time the special event period arrives. This is the first time so many NASA stations will be represented on the air at one time. Contacts with these stations during the special event period will be confirmed on request with a certificate to commemorate man's first steps on the Moon and the special event activity.

Details:

Event Name:
Apollo 11 Moon Landing 25th Anniversary

Date/Time Period:
1700Z, July 19 through 0500Z, July 22
(1300 EDT, July 19 through 0100, July 22)

Modes:
CW, SSB, FM, Packet, Pactor, Amtor, RTTY, SSTV, ATV, Satellites.

Frequencies:
HF CW/SSB: Check 11 (as in Apollo 11) kHz up from the bottom of the General Class portion of the amateur radio bands (except 10m SSB: 28.411+ MHz).

Other Modes:
Check modes/frequencies as indicated by the individual stations below.

QSL Information:
A certificate is being designed to commemorate this special event activity, which will be individualized for each special event station.

Domestic Stations: Send a 9" x 12" self-addressed, stamped envelope to
the callbook address (CBA) of the station worked or to the address
specified by the station worked. Attach $0.52 postage to cover
return mailing.

DX Stations: Send a 9" x 12" self-addressed envelope to the
appropriate address, with sufficient IRC's or U.S. Postage for return
mailing of up to 1.5 oz (42.52 grams).
Europe = $1.40US postage (3 IRC);
Mexico = $0.63US postage (2 IRC);
Canada = $0.55US (2 IRC).

Individual Station Specifics:
==========

Ames Amateur Radio Club,
NASA Ames Research Center, Moffett Field, CA
Callsign: K6MF
Bands: 40-10m (excl. WARC), 2m
Modes: CW, SSB, FM
Special Freqs: 145.585 MHz
QSL Address: AARC

1042. 70cm Microsats

Newsgroup: rec.radio.amateur.space
Date: 1994-07-13 21:15:44 UTC
From: "Colin Schmutter"
Message-ID: <CswDq9.MuM@epaus.island.net>
Source record: 27346

I have started taking an interest in the microsats, mainly those with mode J configuration.

I have been monitoring the downlink signals using a J-pole antenna and 70 cm pre-amp (homebrew ARRL handbook designs) and an AOR 2002 scanner set to NBFM to get an idea of the downlink signal strength.

I have found the signals to be very weak using the above and the S meter on the receiver barely lights, even at mid pass.

I have monitored LO19, AO16, KO23, KO25 and others and they all seem very weak.

Given the above configuration would this be what I should expect as far as downlink signal strength.

I didn't want to spend any money on modems etc until I am sure that I have the RF side of things set up correctly.

Any comments would be appreciated.

Colin Schmutter

This doesn't sound good. I get noisy signals with just a BC760xlt
scanner and it's little whip antenna indoors. With the FT736 and a
Comet 2X4Max with no preamp, I get signal strengths of S3-S5 during
the lower part of the pass. I get almost no signal when the birds are
overhead with the Comet omni antenna (it's pattern is optimized toward
the horizon). With a tracking KLM40CX and SSB Electronics Gasfet preamp,
S9++ signals are the norm.

I don't know how deaf the AOR 2002 is, you might want to try a better
radio, like a HT, to eliminate that variable. If the signals are still
weak, you should check your preamp and feedline. A J-pole *should* be
enough antenna to give good signals during at least part of the pass.

Gary

1054. Alaska EME Ham

Newsgroup: rec.radio.amateur.space
Date: 1994-07-15 01:29:26 UTC
From: mm1@hounix.org
Message-ID: <1994Jul15.012926.19799@hounix.org>
Source record: 27354

A few weeks ago, my wife and I were visiting friends in anchorage, Alaska.
While out and about, I came across a large 2 meter EME array. I tried the
door of the house, but no one was home. I never did get another chance to go
back to his house. I did take a couple of pictures of his array.
I would like to get in touch with him, if possible via mail, packet, or
Internet.
He lives near Merrial Field (We could watch the planes take off and land).
The EME array is on a crank up tower and he has another (approx 50') tower
with a tri-bander and a diskcone VHF ant on top of that.
His house is a light brown with dark brown trim.
He lives on a corner lot and the array is almost in his front yard.

Dummy me, I didn't write down his address or the two streets his house is on.

1056. TAPR/AMSAT DSP-93 Kit Announcement

Newsgroup: rec.radio.amateur.space
Date: 1994-07-15 07:17:09 UTC
From: gjones@tcet.unt.edu
Message-ID: <305d5l$bv5@hermes.unt.edu>
Source record: 27355

```
DSP-93
The TAPR/AMSAT Joint DSP Program
------------------------------------------------------------------------
In July 1988, TAPR and AMSAT entered into the Joint DSP Program, in order to
fund the development of an eventual DSP unit for amateur usage. As of the
1993 Dayton Hamvention, the direction of development was focused on a
modular, standalone DSP system proposed by Bob Stricklin, N5BRG, in Dallas,
Texas. The Stricklin KISS design, later renamed DSP-93, offered many of the
things that the initial design goals of the project had specified. Fifteen
months after the decision was made to proceed with the DSP-93 development,
TAPR and AMSAT are both proud to announce that orders for kits will be
taking place July 15th through August 31st for the first 150 units.
The DSP-93 is a complete kit (including box and power supply).

---

If you would like the full announcement, drop me an e-mail and I will
forward it. It is a little long.

Cheers - Greg

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

* STS-65 SAREX ACTIVITY *
========================
The Space Shuttle Columbia had a flawless liftoff on 08-Jul-94 at
16:43:00.083 UTC for a 14-day mission in space. Columbia has been assigned
Space Command Object Number 23173 and International Designator 1994-039 A.

The Shuttle Amateur Radio Experiment (SAREX) packet robot on board the
space shuttle Columbia was activated on 11-Jul-93. The following highly
edited text was copied on 12-Jul-94 at WA5ZIB from the STS-65 shuttle
mission:

W5RRR-1>QST [07/12/94 17:17:00] :
Hello from KC5HBV and KC5FVF aboard the Space Shuttle Columbia
We're well into our mission now conducting materials processing and
life sciences experiments that are paving the way for future operations
aboard our international space station. We've talked to schools in Texas,
Florida, Hawaii and Germany via SAREX and it's been great.

W5RRR-1>QRZ [07/12/94 17:17:57] :

* GARC SHUTTLE RE-TRANSMISSIONS *
==========
The Goddard Amateur Radio Club (GARC) invites interested people to tune in to STS-65 shuttle ground communications transmissions. As a public service to the Amateur radio community, the GARC retransmits space shuttle air-to-ground communications. During the STS-65 mission which also carries a Shuttle Amateur Radio Experiment (SAREX), Amateur radio operators, shortwave listeners, and individuals with scanners can listen to these communications on the following HF (single sideband) and VHF (FM) frequencies:

3.860 MHz (LSB)
7.186 MHz (LSB)
14.295 MHz (USB)
21.395 MHz (USB)
28.650 MHz (USB)
147.450 MHz (FM) in local Washington D.C. metro area

[Info via Erich Franz Stocker, N3OXM]

* APOLLO ANNIVERSARY SPECIAL EVENTS *
==========
At least 12 amateur stations associated with the National Aeronautics and Space Administration will be active July 19 to 22 to commemorate the 25th anniversary of humans landing on the moon, on July 20, 1969, on Apollo 11. The operations will begin at 0700 UTC July 19 and end at 0500 UTC July 22, coinciding with the time the Apollo Moon Lander (the Eagle) was on the moon's surface in 1969.

Stations are expected to be on modes including CW, SSB, FM, packet, Pactor, Amtor, RTTY, SSTV, ATV, and amateur satellites. Here are the 12 stations expected to be active:

Ames Amateur Radio Club, NASA Ames Research Center, Moffett Field, California: K6MF (AARC, Box 73, Moffett Field CA 94035-1000).

Dryden Amateur Radio Club, NASA Dryden Flight Research Center, Edwards, California: KF7GD (NASA DFRC, Attn: Dryden ARC, POB 273, Edwards CA 93523).

Goddard Amateur Radio Club, NASA Goddard Space Flight Center, Greenbelt MD: WA3NAN (GARC, PO Box 86, Greenbelt, MD 20768-0086).

Guam Contingency Landing Site Amateur Radio Group: KC4YDP/KH2 (NASA RADIO, Kennedy Space Center FL 32899).

NASA Headquarters Amateur Radio Group, Washington, DC: N4ZR (2003 Sarazen Place, Reston VA 22091-3809).

Jet Propulsion Laboratory Amateur Radio Club and Goldstone Amateur Radio Club, Jet Propulsion Laboratory, Pasadena, California: W6VIO (JPLARC, M/S 168-327, 4800 Oak Grove Dr, Pasadena, CA 91109).

Johnson Space Center Amateur Radio Club, NASA Johnson Space Center, Houston, TX: W5RRR (JSC ARC/W5RRR, Johnson Space Center, Houston TX 77058).

Kennedy Space Center Amateur Radio Group, Kennedy Space Center, Florida: KC4TCV (NASA RADIO, Kennedy Space Center FL 32899).

NASA Lewis Amateur Radio Club (NLARC), NASA Lewis Research Center, Cleveland, Ohio: AK8Y (NASA Lewis Amateur Radio Club, 21000 Brookpark Rd, MS 54-6, Cleveland OH 44135).

Marshall Amateur Radio Club, NASA Marshall Space Flight Center, Huntsville, Alabama: WA4NZD (Marshall Amateur Radio Club, CM21X, MSFC AL 35812).

Stennis Space Center Amateur Radio Club, NASA Stennis Space Center, Mississippi: K5GY (Stennis Space Center Amateur Radio Club, Bldg 1201, Stennis Space Center MS 39529).

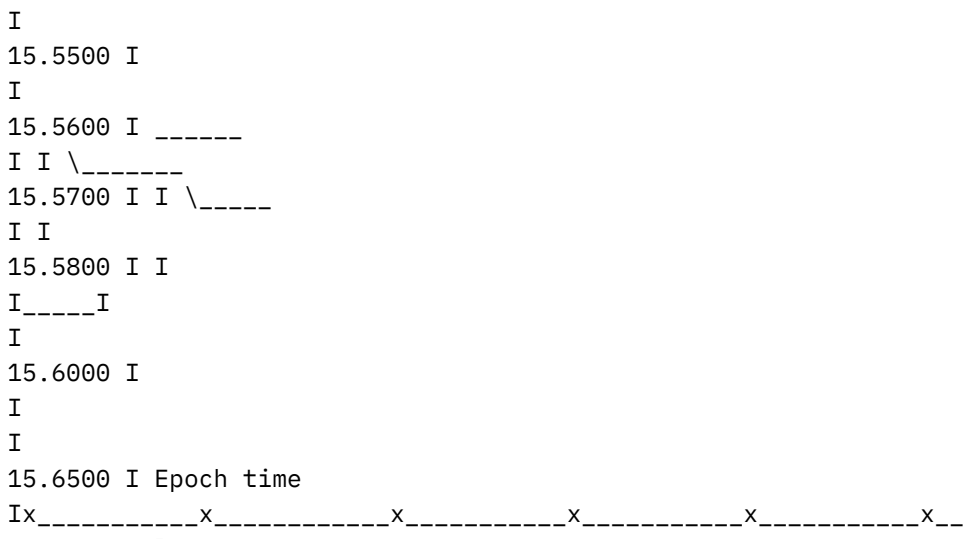
Wallops Island Amateur Radio Club, NASA Wallops Flight Facility, Wallops Island, Virginia: KE3ND (Wallops Island ARC, NASA Wallops Flight Facility, Building E-134, Wallops Island VA 23337).

White Sands Complex Amateur Radio Group, NASA White Sands Test Facility, Las Cruces, New Mexico: KF7E (P.O. Box 627, Organ NM 88052).

[Info via ARRL]

* MIR ORBIT ADJUSTMENTS *
==========
The following graphic depicts the mean motion (which is inversely proportional to mean orbital altitude) of Mir over the past several months:

TIME REVOLUTION (summary) for MIR Complex 16609
(Period= day 130 to day 185 1994)



Orbit adjustments were made on 12-March, 12-May, and on 03-July when Mir docked with the Soyuz TM-19 module.

1067. Two-Line Orbital Element Sets (TLE431)

Newsgroup: rec.radio.amateur.space
Date: 1994-07-15 19:10:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.774299400@afit.af.mil>
Source record: 27360

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

1068. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1994-07-15 19:12:21 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.774299541@afit.af.mil>
Source record: 27161

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1070. Re: Alaska EME Ham

Newsgroup: rec.radio.amateur.space
Date: 1994-07-15 19:21:05 UTC
From: micron3@aol.com
Message-ID: <306nj1$r4u@search01.news.aol.com>
Source record: 27171

In article <1994Jul15.012926.19799@hounix.org>, mm1@hounix.org (John Donaldson) writes:

essage-ID: <1994Jul15.012926.19799@hounix.org>

> A few weeks ago, my wife and I were visiting friends in anchorage, Alaska.
>While out and about, I came across a large 2 meter EME array. I tried the >door of the house, but no one was home. I never did get another chance to go
>back to his house. I did take a couple of pictures of his array.
> I would like to get in touch with him, if possible via mail, packet, or >Internet.

My data base for 2 Meter EME types has two listings for Alaska

Mike Turner KL7X
2900 Wendy's Way
Anchorage, Alaska 99517

Chris Hazlitt KL7FB
3741 Gary Cooper Cir
Anchorage, Alaska 99507

The data base lists KL7X as having 12 yagis of 8 elements each but does not
list KL7FB's array. Hope this helps.

Terry KJ7F

1075. info on parabolic dish

Newsgroup: rec.radio.amateur.space
Date: 1994-07-16 17:59:46 UTC
From: subas@intnet.pc.my
Message-ID: <774381586.9snx@intnet.pc.my>
Source record: 27166

hi there everyone!!i am trying to find out some info about a dish that i bought.the length of the dish is about 9ft long.can someone please tell me why do people say that the 12ft dish can receive more channels then the 9ft dish.does the length of the dish make any diffrent.can sommeone also please tell me what is the best way to allign the dish.this is the first time that i am installing a satelite parabolic dish.the colour of my plates are silver in colour.i would like to paint it black.does painting it black effect the signal.will there be any signal lost.the dish that i bought did not come with a installation manual,so i really need some help in installing the dish. please help!!!

thaking you in advance.
yours trully

SB SAREX @ AMSAT $STS-65.011
SAREX Keps 7/16 at 10:20 UTC

Greenbelt, MD 7/16 at 10:20 UTC

At this time, the official SAREX Orbital element set for the STS-65 Space SShuttle Mission is set GSFC-025a with the NORAD drag values corrected by Gil Carman, WA5NOM. This set was generated by Ron Parise, WA4SIR at the Goddard Space Flight Center. Predictions with this set were 3 seconds earlier than GSFC-023a at 0830 UTC on orbit 123.

STS-65
1 23173U 94039A 94197.27576731 0.00077033 00000-0 23048-3 0 259
2 23173 28.4687 311.0423 0002865 30.0967 329.9809 15.90866972 1221

Satellite: STS-65
Catalog number: 23173
Epoch time: 94197.27576731 (16 JUL 94 06:37:06.30 UTC)
Element set: GSFC-025a
Inclination: 28.4687 deg
RA of node: 311.0423 deg Space Shuttle Flight STS-65
Eccentricity: 0.0002865 Keplerian Elements
Arg of perigee: 30.0967 deg
Mean anomaly: 329.9809 deg
Mean motion: 15.90866972 rev/day Semi-major Axis: 6677.9878 Km
Decay rate: 7.7033E-04 rev/day*2 Apogee Alt: 301.51 Km
Epoch rev: 122 Perigee Alt: 297.69 Km

NOTE - This element set is based on NORAD element set # 025.
The spacecraft has been propagated to the next ascending
node, and the orbit number has been adjusted to bring it
into agreement with the NASA numbering convention.

Submitted by Frank H. Bauer, KA3HDO for the SAREX Working Group

SB SAREX @ AMSAT $STS-65.012
SAREX Update 7//17 at 7:30 UTC

Greenbelt, MD July 17, 1994 at 7:30 UTC

SAREX Schools

The school group contacts with the Space Shuttle Columbia crew are nearly complete. Twelve of the thirteen schools planned for this mission have had successful contacts. The Bair Middle School in Sunrise, Florida initiated the school group contact parade on Saturday July 9. 22 students communicated with mission commander Bob Cabana, KC5HBV. Commander Cabana has been at the mike for most of the school contacts for this flight. He has told the students to "Study hard, especially in science and math" and to "not give up." He stated further that: "I was not selected to be an astronaut on my first try, but I kept trying and that is why I am here today...so keep trying!."

In addition to the Bair School, Commander Cabana also communicated with the Sacred Hearts Academy in Honolulu, Hawaii on July 10, the Fronhofer Realschule in Ingolstadt, Germany and the Richland Elementary in Ft. Worth Texas on Monday July 11 and the Our Lady Queen of Heaven school on Tuesday July 12. KC5HBV was also at the mike during the South Seminole Middle School contact in Casselberry Florida and the Washington Elementary School District contact in Phoenix, Arizona on Wednesday July 13. On Wednesday July 14, Bob Cabana had a 3.5-4 minute chat with the students at Brentwood School in Sandersville, Georgia and the students at the West Oak High School in Westminster, South Carolina. During the West Oak contact, AM radio station WGOG broadcast the SAREX contact live. It was estimated that 10,000 people listened to this live broadcast. On Saturday July 16, the students at the Granite Mountain Middle School in Prescott, Arizona had a very early morning (5:53 am) contact with Commander Cabana. 13 students asked their questions during their pass through a SAREX telebridge in Corpus Christi, Texas. On the morning of July 15, pilot Jim Halsell answered 8 questions from an excited school group at the West Monroe High School in West Monroe, Louisiana. At the conclusion of the contact, West Monroe contact coordinator Mark Ketchell commented that as a result of the SAREX

contact it looks like there may be a new amateur radio club forming at the school. Many of the school group contacts, including the West Monroe High School, have been transmitted live via WA3NAN.

Japanese payload specialist Chiaki Mukai "Phoned Home" through SAREX on Wednesday July 13 by talking to a youth group in Japan. Despite it being a 2:03 in the morning, ten students at the Tatebayashi Children's Science Exploratorium in Gunma, Japan communicated with Dr. Mukai through the SAREX radio. All that witnessed this contact could sense the emotionally filled replies from Dr. Mukai as she answered her homeland student's questions in Japanese. When one of the students asked about the shuttle food, Dr. Mukai proudly mentioned that the STS-65 crew had a Japanese dinner the night before. The contact was shown throughout the Exploratorium on closed circuit TV. Sixty people, all Japanese media, crowded in the room where the students made contact with Dr. Mukai. This contact was covered by all the major Japanese television stations and several radio stations and newspapers. From all accounts, this contact appears to be the most comprehensive coverage given to SAREX. The SAREX Working group will share more information as we receive it.

Most of the above school groups were completed using AMSAT's telebridge system. The telebridge system is an international network of seasoned satellite ground stations that relay the communications of the astronauts from their station to the school through a phone bridge. Darome Telecommunications in Chicago donates their services to SAREX for these events. Bob Douglas, W5GEL, and Bob Diersing, N5AHD, in Texas and Dick Flagg, WH6CHU and his team in Hawaii were the SAREX team's primary telebridge ground stations for this mission.

Future SAREX operations

With nearly all the school group contacts complete, two school group backup passes have been cleared for possible general QSO opportunities. While we cannot guarantee availability, there is a high probability that the STS-65 crew will have the SAREX radio (packet or voice) operational over the continental U.S. on these passes. These opportunities include a pass on orbit 141 at MET 8 days 18 hours 45 minutes (7/17 at 11:28 UTC) and a pass that occurs around MET 9 days 18 hours 48 minutes (7/18 at 11:31 UTC). The SAREX downlink frequency is 145.55 MHz. Voice uplinks are 144.91, 144.93, 144.95, 144.97 and 144.99 (except Europe). For European hams, the voice uplinks are 144.80, 144.75 and 144.70. STS-65 voice callsigns are KC5HBV (Bob Cabana) and KC5FVF (Don Thomas). The worldwide packet

uplink frequency is 144.49. The packet radio callsign is W5RRR-1. Please note that the attitude of the shuttle orbiter provides a clear path for SAREX operations during the last half of the 8 minute period when the shuttle is above your horizon. Our school group contacts were averaging 3.5-4 minute contacts. So don't give up after the first couple of minutes after the scheduled AOS. Good Luck!!

Submitted by Frank H. Bauer, KA3HDO for the SAREX Working Group

SB SAREX @ AMSAT $STS-65.016
STS-65 World R/S Times 07/17

Below are the rise and set times for STS-65 for selected worldwide cities
over the next two days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note that
the times shown are UTC and NOT LOCAL TIME. This listing includes only
those passes with an elevation greater than 5 degrees. For information
regarding SAREX frequencies and operations procedures, check your
local PBBS, or bulletins from W1AW, W5RRR, W6VIO or WA3NAN.

Symbol key: rise = time that shuttle appears above horizon
tca = time of closest approach to observer
set = time that shuttle disappears below horizon
el = maximium elevation above horizon
geo = geometry: A = Ascending orbit, moving south to north
D = Descending orbit, moving north to south
E = passes east of observer
W = passes west of observer

SB SAREX @ AMSAT $STS-65.017
SAREX Keps 7/17 at 13:50 UTC

Greenbelt, MD 7/17 at 13:50 UTC

At this time, the official SAREX Orbital element set for the STS-65 Space Shuttle mission is set GSFC-027a with the NORAD drag values corrected by Gil Carman, WA5NOM. This set was generated by Ron Parise, WA4SIR at the Goddard Space Flight Center. On orbit 140, predictions with this set were 2 seconds later than GSFC-025a and one second earlier than GSFC-023a. Predictions with set GSFC-021 are now 33 seconds too late because it had the Norad drag values.

STS-65 SAREX Mission Continues

The STS-65 SAREX missions continues smoothly. The packet radio ROBOT is working perfectly and many stations are connecting and receiving their "confirming" QSO number. All radio amateurs are invited to try their hand at making a voice/packet contact with the astronauts aboard STS-65.

Monitor the WA3NAN Shuttle re-broadcast frequencies and daily ARRL bulletins to pick up the latest element sets. The following are the frequencies for the re-broadcasts:

Goddard Amateur Radio Club, WA3NAN, Greenbelt Maryland, SAREX Bulletins and Shuttle Retransmissions 3860 KHz, 7185 KHz, 14,295 KHz, 21,395 KHz, 28,650 KHz and 147.45 MHz (FM)

ARRL Amateur Radio Station, W1AW, Newington, CT SAREX News Bulletins 3990, 7290, 14,290, 18,160, 21,390, and 28,590 KHz and 147.555 MHz (FM)

Also, bulletins available on INTERNET, via AMSAT News Service (ANS)
bulletins, Compuserve, and many of our local Packet Radio BSS.

The following is a summary of the frequencies that the Shuttle astronauts
will use during SAREX operations:

All operations in split mode. Do not transmit on the downlink frequency.

Voice Freqs: Downlink: 145.55 MHz (Worldwide)
Uplinks : 144.91, 144.93, 144.95, 144.97, 144.99 MHz (Except
Europe)
144.70, 144.75, 144.80 MHz (Europe only)

Packet Freqs: Downlink: 145.55 MHz
Uplink : 144.49 MHz

Note: The crew will not favor any specific uplink frequency, so your
ability to work the crew will be the "luck of the draw."

The following is the latest keplerian element set for STS-65:

>I have been thinking about what it would take to put together a portable
>9600 baud satellite station? After all, the satellite is a cube about 9"
>on a side, can we put together something about that size?

Sure, but the satellite is so small because it is counting on your system
being a lot bigger!

>My idea is to have a radio, tnc, antenna, and laptop computer that could
>be powered from a battery and used anywhere. I thought I would pose a few
>questions to the net to gather up some suggestions from those with 9600
>baud pacsat experience. I don't know if I will really put this together,

>RADIO:
>First thought is to use one of the newer dual banders that come ready for
>9600 packet. These have the new jack on the back that connects the TNC to
>the proper stages within the radio to support 9600 baud. One of the
>problems that I see with these radios is the IF bandwidth to allow for
>Doppler shift of +/- apx 10KHz. Most of these radios tune in 5KHz steps.
>So do we have a problem with tuning needed to track Doppler with this
>style of radio? Also, the cost of these radios is rather high.

The less expensive radios you are talking about will simply not work. For 9600
baud, you MUST tune for Doppler, as well as have the RIGHT bandwidth. It takes
very little to destroy a 9600 baud packet, about 1/10th that of a 1200.

>Another idea is to use an older 25 watt 2 meter radio for the uplink. This
>radio would need to be modified to drive the vco from the TNC. These are
>pretty cheap. For the downlink, could a simple scanner work? Bruce, N4USH,
>posted a message about using a Radio Shack Pro 2006 scanner to receive
>downlinks. I have modified a scanner for APT fax use by changing out the
>IF filter with a filter of wider bandwidth. Bruce used the search mode of
>the scanner to change to a new frequency to follow the sat's Doppler
>change. The system would also probably require a preamp to help out the
>receiver. Comments on using this setup for the radios?

Same problem as above. Both are multiplied by the lack of gain of portable
antennas.

>TNC:
>There seems to be many 9600 baud G3RUH compatible TNCs on the market. I

>have seen the ads for AEA, DRSI, and others. The DRSI looks interesting as
>it draws only 40mA. Also, using a TNC that supports normal 1200 baud allows
>connection to common PBBS and users. Are any of these TNCs better or
>easier to use than others?

Wait for a couple of weeks, and the new Kantronics will be available. It will
do 9600, 1200, as well as dual simultaneous!

>ANTENNA:
>Couple of ideas here. A couple of quarter wave ground planes could be
>used. I see that several of the antenna manufacturers sell 144/440 4/5
>element beams using a common boom. MFJ sells one for around $40. One of
>these could be mounted to a camera tripod and hand tracked during the
>pass. The beamwidth of these short beams is wide, which helps to simplify
>tracking of the satellite. The antenna needs to be easy to assemble and
>disassemble to allow for easy transport.

Two of the beams might just work, possibly even one, if it was well built.
"Ground Plane" (vertical) antennas don't have nearly enough gain.

>COMPUTER:
>A portable of probably at least 386SX power with hard disk would be needed
>to run PB, PG and a tracking program. What is the minimum computer
>needed?

A 386 would do quite well for PB and PG. Avoid an SX, and be sure to get a
math coprocessor. Tracking runs S-L-O-W without it!

> The tracking program could generate an AZ/EL list before the pass
>and either print a list (if printer available) or the user could write
>these numbers down. Then during to pass the operator hand tracks the
>satellite and lets PB or PG run. Being more of a Mac person, can PB & PG run
>under Soft PC on a Mac portable?

Avoid a Mac like the plague for anything related to Amateur Radio. It may be
familiar, but when you try to run PB or PG, even the fastest emulator will
have a real hard time keeping up with 9600. I expect serial overruns aplenty.
There is a lot of Ham related software for the PC, very little for the Mac,
and an older laptop of the PC variety will run you less $$ anyway.

>BATTERY:
>A gel cell could be used to power everything. Probably something in the 12
>AH range would be needed. A solar panel could be used to charge the
>battery between passes. A power cord to connect the system into a carUs
>cigarette lighter would also be useful.

Good idea, but don't forget to factor in for a possible 2 meter amp. There is
a lot of noise on that band anymore, and the sats hear a whole lot more of it
than we do!

>So, it seems that it is possible to build a portable 9600 baud satellite
>station that would fit inside a camera bag or brief case. Has anyone put
>together such a package? Any other comments about this portable idea?

The radio would have to be something like the Icom 820H (no external amp needed) or maybe some of the older seperates if you want to tune the Doppler manually. I would be more inclined to try for the 1200 psk sats. They can definitely be worked with much smaller equipment. I have done quite a bit of investigating of all of this for a trip I plan on taking to Hawaii in my 30' sailboat. After 3 years of Packet satellite at 1200 and 9600 baud, I just don't want to be away from it!

I know of a few stations that have had good success on psk with very modest stations. The biggest thing to watch for is that the receiver needs SSB, and MUST have some sort of step system for tuning. This is usually done with microphone up-down buttons. This is needed to keep up with the Doppler, which is done automatically by the psk modem once you get it started, leaving you free to play with PB and PG.

For the antennas, the Eggbeaters look real good, and I beleive that they can be easily put away for travel. Plus, you wouldn't need to turn them! The performance would be less than optimum, and the modem would probably lose lock sometimes, but they do work.

Overall, for a modest Packet satellite station, the 9600 baud birds are too finicky. Try the 1200 ones, and there are some stations who will be glad to transfer messages for you.

>I'll compile a list of all the responses that I receive. If there is
>interest I'll post the responses.

I would be interested, to be sure, to help me in my preparation!

Date: 1994-07-18 02:15:00 UTC
From: darryl.linkow@ledge.com
Message-ID: <cf.767.489@ledge.com>
Source record: 27176

W1>Keplerian bulletins are transmitted twice weekly from W1AW.
W1>The next scheduled transmission of these data will be Tuesday,
W1>July 19, 1994, at 2230z on Baudot and AMTOR.

Just wondering if you could tell me what software program I use
with these elements and where I get this software. Also, what
software do I use for the Space Shuttle statistics that I have seen
posted here?

Greetings. My parents computer ate the announcement from the folks
at VE3ONT when I downloaded it (a mac, a mac, my kindom for a mac). Anyways
if anyone still has it could they repost or email it to me.

Thanks in advance.
Michael KD6PUD/AG

1089. WEFAX from PYE TELECOMMUNICATIONS PT AM 10DYV Receiver?

Newsgroup: rec.radio.amateur.space
Date: 1994-07-18 03:40:50 UTC
From: wwg@coutts.UUCP
Message-ID: <210@coutts.UUCP>
Source record: 27217
Cross-posted to: sci.electronics,rec.radio.amateur.space,rec.radio.amateur.misc

The issue: Can this receiver work at 137+ Mhz?

I have a PYE aircraft AM transceiver, that was modified to be a RX only unit (which is fine), using the two crystal sockets for two different receive frequencies, since the TX crystal is no longer needed.

The current crystals cause the receiver to receive 123.2 and 122.8 Mhz at the moment. I want to receive the NOAA satellite WEFAX signals on 137.5 and 137.62 Mhz using this old receiver. The crystals currently in there are in the:

(123.2 - 10.7) / 3 = 37.5 Mhz neighbourhood (this is verified).

The 137.5 Mhz freq requires a 42.26666 Mhz crystal.

The receiver details:

PYE TELECOMMUNICATIONS Model PT AM 10DYV
Serial 1944D, input 12 Volts, and has 4 tubes, of which none are required for receiving (receiver works with switch on standby, without lighting the tube filaments).

It seems a bit of a stretch to go from a 37.5 Mhz crystal to 42.266 Mhz, but there is a series connected inductor that is tunable (at least in the current rendition of its wiring -- I don't have a schematic, so I don't know if this is original or not).

I'm not sure how fussy the front end in this radio is... I doubt any serious problem there. Again with no schematic, and without having done much tracing from the antenna yet, its my opionion that there is not much "tuned circuit" to discriminate 137 Mhz from 120 Mhz.

Anybody familiar (or not) with this radio, or someone with access to its schematic wish to comment on this? I'll have to get crystal(s) made to try this, which is the reason for this post. Should I invest/waste my money on crystals for this end?

Of course, I'm assuming that NOAA signals are AM audio signals. However, if this should turn out to be FM instead-- no big deal. I can build a demod circuit after the IF section. Email preferred, thanks.

1090. Re: TAPR/AMSAT DSP-93 Kit Announcement

Newsgroup: rec.radio.amateur.space
Date: 1994-07-18 05:45:59 UTC
From: gjones@tcet.unt.edu
Message-ID: <30d4un$ldg@hermes.unt.edu>
Source record: 27174

The DSP-93 text is now available on the TAPR Internet server.

Send mail to 'file-request@tapr.org'.
In the message body include: GET /pub/tapr/dsp93.txt

This will get you the complete announcement on the TAPR/AMSAT DSP-93 kit.

You can also get an entire directory of TAPR files with the DIR command.
Help is received by using HELP in the message body.

Cheers - Greg

President -- Tucson Amateur Packet Radio Corp

I recently came across a program that would help to determine
true north for any location. Basically it gave the time when
the shadow cast by an object would be due north (the sun always
shines, doesn't it?). Well, of course, I lost it and can't seem
to find it. Am really too cheap to buy a compass. Anyone know of
a landline bbs where I could download this program again? Suggestions
on how to save it in the future are not necessary as I am recieving
counselling presently! Thanks de John/NS1Z 0005018901 @ mcimail.com

Hi,
I am one of the control operators of the w4bs repeater system in Memphis,TN.
We are looking for the frequency and duration of the NASA courtesy tones.

We would like to change the courtesy tones of our repeaters to remember the
25th Anniversary of the first man on moon.

If anybody has info on these tones please send me a e-mail msg.

Thanks in advance,

Suresh N9GSA

This is a really stupid thing to say...typical bias from a "PC" clone... Terry Stader posts a list every month to this newsgroup listing amateur radio software available for the Mac. There is lots of software available and a lot more on the way.

1096. Smartlevel

Newsgroup: rec.radio.amateur.space
Date: 1994-07-18 19:00:28 UTC
From: "l.h. bol" <lbol@julian.uwo.ca>
Message-ID: <Pine.3.88.9407181402.A17613-0100000@julian.uwo.ca>
Source record: 27186

While at Dayton this year I picked up a Smartelevel (microprocessor controlled level) that can communicate with a computer to give elevation information for tracking purposes (you mount it on the antenna strcuture).

The problem is that when I bought it, I was told that the information I need to interface to it and the communication protocal was commonly available on most Ham radio BBS's. I haven't been able to find anything.

Does anyone out there know what it is I'm refferring to and can point in the direction of the info I need to talk to this thing ?

Thanks in advance.

30 To be launched on need in FY '95

Notes
-----
1. NASA Catalog Number is also known as NORAD or U.S. Space Command object number.
2. No orbital plane position = satellite no longer operational.
3. Clock: Rb = Rubidium; Cs = Cesium
4. S/A had been enabled on Block II satellites during part of 1990; S/A off between about 10 August 1990 and 1 July 1991 due to Gulf crisis; standard level re-implemented on 15 November 1991. Currently, PRN15 and PRN20 appear to have little or no S/A imposed.
5. Anti-spoofing was activated on 94-01-31 at 00:00 UT on all Block II satellites. (ref. NANU 050-94042)
6. PRN number of SVN32 was changed from 32 to 01 on 93-01-28.
7. PRN05 and PRN06 are equipped with corner-cube reflectors for satellite laser ranging (SLR). SLR tracking of the satellites will permit onboard clock errors and satellite ephemeris errors in GPS tracking to be differentiated.
8. The decommissioning date for PRN06/SVN03 is the date of termination of operations of this satellite (ref. USNO) and is about 3 weeks later than the date GPSIC gives for "deactivation".
9. The PRN06/SVN36 launch included the SEDS-2 tether experiment on the Delta II rocket body (object 23028, 1994-016B). The tether was broken by an impact on 94-03-15. The SEDS-2 end mass subsatellite and about half of the tether re-entered within a few orbits. 11 km of tether remained attached to the Delta rocket. The tether was clearly visible to the naked eye and many sightings were reported. The rocket and remaining tether re-entered on 94-05-08. (ref. Jonathan McDowell)
10. Although its L1/L2 bands were left on, PRN12 was set unusable from 94-06-17 until 94-07-08 due to power supply problems during its eclipse season. (ref. NANUs 174-94171, 181-94186, 182-94192)
11. PRN13 was boosted to a higher orbit for disposal on 94-06-20 and will not return to service. The satellite had been unusable since 94-02-27 due to "end of life testing." (ref. NANUs 083-94059 and 176-94173)

ARLS027 SAREX Apollo 11 event

SAREX Apollo 11 Special Event

In commemoration of the twenty-fifth anniversary of the Apollo 11 mission, the STS-65 SAREX station on board the Space Shuttle Columbia will be operated as a special event station from 1713 UTC, July 19 until 1343 UTC, July 21. Unscheduled voice contacts will be made when the crew is available.

The SAREX station joins at least 12 other amateur stations associated with the National Aeronautics and Space Administration in commemorating the landing of the Apollo Moon Lander, the Eagle, on the moon's surface in 1969. Contacts made during the event will be eligible for a special commemorative certificate. Please send your report and QSL with a large 9-inch by 12-inch self-addressed stamped-envelope to the ARRL Educational Activities Department, STS-65 Apollo Special Event, 225 Main Street, Newington, CT 06111.

SAREX operates split-frequency. The downlink, or receive frequency for all SAREX activities is 145.55 MHz. Please do not transmit on this frequency. The uplink, or transmit frequencies for voice are 144.91, 144.93, 144.95, 144.97 and 144.99 MHz. In Europe, the voice uplink frequencies are 144.70, 144.75 and 144.80 MHz. The worldwide packet uplink frequency is 144.49 MHz. Please, transmit only when the Shuttle is in range and on the air. Crew call signs for voice are Commander Robert Cabana, KC5HBV and Mission Specialist Donald Thomas, KC5FVF. The packet call sign is W5RRR-1. W5RRR is the call sign of the Johnson Space Center Amateur Radio Club which supports SAREX flight activities and hardware aboard the space shuttles.

The following Keplerian elements were provided by Gilbert Carman, WA5NOM and Ron Parise, WA4SIR for the SAREX Working Group.

SAREX Airshow Contact

Approximately 100,000 attendees at the Aerospace American annual airshow in Oklahoma City heard a 2-way Shuttle Amateur Radio EXperiment (SAREX) contact on July 17. Present at the airshow was retired three-star Air Force Lieutenant General Tom Stafford. He was patched by telephone to Commander Bob Cabana, KC5HBV on board the Space Shuttle Columbia via amateur stations WH6CJU in Hawaii, N6IZW in San Diego, CA, and W5GEL in Corpus Christi, TX. Each of the stations are part of a SAREX worldwide telebridge ground station network.

General Stafford is a former astronaut who flew aboard the Gemini 9 and Apollo 10 missions, and commanded the US/Russian Apollo-Soyuz test project. The SAREX exchange of greetings between Stafford and Cabana reflected upon the 25th anniversary of the Apollo 11 mission to the moon.

The contact was managed by Frank Bauer, KA3HDO at the Goddard Space Flight Center in Greenbelt, MD, and by Lou McFadin, W5DID and Gil Carman, WA5NOM from the SAREX Control Room at Mission Control at the Johnson Space Flight Center in Houston, TX.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1102. Antenna questions

Newsgroup: rec.radio.amateur.space
Date: 1994-07-18 22:46:44 UTC
From: Wayne_Estes@csg.mot.com
Message-ID: <9407181746.ZM13142@SALCIUS2>
Source record: 27188

I installed Az/El rotors on a tripod on my roof this weekend. Next, I plan to buy some M2 antennas: 14 el. CP yagi for VHF
30 el. CP yagi for UHF

I must use the short VHF antenna because I have light-duty rotors, and a long boom would bump into tree branches and an exhaust vent.

Can anyone answer the following questions?

1. Is it (mechanically) easy to build a phasing/relay assembly for RH/LH polarity switching on the M2 antennas?

2. Is the M2 crossboom really 10 ft. long when assembled?

3. Would a 7 ft. crossboom be long enough for VHF and UHF yagis on each end, and a future 2x3 ft. dish in the middle? (i.e. without undesired interaction between the antennas)

4. Would a preamp at the VHF yagi feedpoint distort the pattern of the antenna? Or should I mount the preamp on the mast?

5. Do some preamp models switch fast enough (PIN diodes maybe?) to allow me to transmit "through" the preamp without a timing circuit that bypasses the preamp before keying the transmitter? If so, do these preamps require a PTT line routed up to the preamp, or do they detect the RF?

Please respond to wayne@csg.mot.com, or to the newsgroup. Thanks in advance.

Not for communication with the pacsats there isn't, or do you know of a
mac based package that replaces the pb/pg suite? The only way I know
that you can work the pacsats using broadcast/ftl0 protocal with a mac is
with an IBM PC emulator.

>

What complete and utter nonsense. For a start there are several Sat tracking programmes for the Mac at least one that I use has AZ/EL control and yes there is also a version of Broadcast for the Mac.

As to there been "very little for the Mac," I personally have about 12 meg of ham software for the Mac covering everything from Sats, DXing, TCP/IP, AX25 Packet, Grayline etc etc. One things for sure, the vast majority of it is a lot better written than most Ham PC software I've ever seen. If anyone is interested I'd be more than happy to send you a list.

While I agree with most of your reply it would seem that there are some areas were perhaps a little more home work could have been done.

Kind regards,

Sean.

1106. Lunar gravitational attraction toward satellites?

Newsgroup: rec.radio.amateur.space
Date: 1994-07-19 18:19:25 UTC
From: dbushong@wang.com
Message-ID: <Ct79KF.78q@wang.com>
Source record: 27192

I received the following two questions and have no clue what the answers are. Would anyone care to offer an opinion?

1. Does the moon's gravitational attraction exert enough force on geosynchronous satellites to cause their position to require adjustments?

2. Is there a laboratory instrument that shows/measures the attraction force between objects? If so, how does it work?

Thanks for any information you may provide, either e-mail or followup post here.

>Can anyone answer the following questions?

>1. Is it (mechanically) easy to build a phasing/relay assembly for RH/LH
>polarity switching on the M2 antennas?

Answering the mechanical part of the question is simply and issue of having
space on the M2 boom for a relay box and the phasing line.

Assuming that the M2 comes with a 50 Ohm phasing line for generating the RH
or LH polarization, inserting a relay should not be hard. Do you have the
information to do the phase shifting?

>2. Is the M2 crossboom really 10 ft.
long when assembled?

>3. Would a 7 ft. crossboom be long enough for VHF and UHF yagis on each end,
>and a future 2x3 ft. dish in the middle? (i.e. without undesired interaction
>between the antennas)

Yes, I have used 6 to 8 feet and have had no serious (read measureable)
problems with my set up. Set up is currently, 12 turn helix on UHF and 10
element crossed yagis on 145 MHz. Tripod mounted on 7 foot cross boom.
All homebrew by the way.

>4. Would a preamp at the VHF yagi feedpoint distort
the pattern of the>antenna? Or should I mount the preamp on the mast?

Again mounting the preamp is mostly a mechanical issue. However, you do want
to place it in the feedline before the phasing shifting relay. My preamp
is mounted in an aluminum box on the tripod and works good.

>5. Do some preamp
models switch fast enough (PIN diodes maybe?) to allow me to>transmit
"through" the preamp without a timing circuit that bypasses the>preamp before
keying the transmitter? If so, do these preamps require a PTT>line routed up
to the preamp, or do they detect the RF?

NO, please don't trust any switching method that doesn't use a timing circuit.
The cost of the preamp vs the timing circuit has no comparison.

1108. RS-10 ops for WA3NAN special event

Newsgroup: rec.radio.amateur.space
Date: 1994-07-19 19:08:19 UTC
From: "Walter K. Daniel KE3HP" <wk02593@worldlink.com>
Message-ID: <2983729368.0.wk02593@worldlink.com>
Source record: 27198

[Note: I tried sending this to amsat-bb at 1200 EDT on 19 July. I still haven't seen this in my mailbox, so perhaps amsat-bb is backed up.]

It appears that Pat Kilroy WD8LAQ and I will be operating the NASA Goddard Space Flight Center station WA3NAN for some RS-10 passes on 20 and 21 July. As you may be aware, amateur radio clubs at just about all NASA facilities are participating in the special event to commemorate the Apollo 11 landing.

The rule for frequencies for this event is 11 kHz up from the bottom of the General class portion of the subband. For RS-10, USB ops are traditionally at 29.380 MHz and up. Add 11 kHz and you'll get 29.391 MHz, our chosen downlink frequency. At the beginning of the pass, the uplink frequency will be approximately 145.8928 MHz. In the middle of the pass (no Doppler), the uplink will be approximately 145.8958 MHz. In case of other QSOs or QRM, we'll move up in frequency.

Here are three RS-10 passes we'll make sure to cover. Pat may try to cover some additional passes that occur one orbit before or after the two high-elevation passes. The following list is an OrbiTrack track for Washington, DC. Note that time is Eastern Daylight Time.

RS-10/11
Time EDT Az El Range Doppler
DOW MM/DD/YY HH:MM:SS Deg Deg km Hz

Wed 07/20/94 12:55:26 355.6 10.6 2737 3536 Rise

Thu 07/21/94 13:31:36 272.8 52.8 1215 164 Max
Thu 07/21/94 13:37:33 194.9 11.4 2655 -3409 Set

For any contacts with WA3NAN _only_, here's QSL info: Domestic stations send a 9" by 12" self-addressed stamped envelope with $0.52 postage to the address below. Canadians need to supply $0.55US (2 IRC) while Mexicans need to supply $0.63US (2 IRC) in postage in addition to the self-addressed envelope.

The WA3NAN address: GARC, PO Box 86, Greenbelt, MD 20768-0086 USA

Please keep in mind that this info is for WA3NAN _only_; see the appropriate bulletins for QSL info for the other NASA club stations.

We'd like to thank the Goddard Amateur Radio Club for allowing us to intrude on their HF operations for these passes. We'd also like to thank GARC once again for allowing us to use their repeater for the weekly Washington-area AMSAT net. Don't forget that these are the same folks who bring you the Shuttle retransmissions!

Hope to work you through RS-10!

73, Walt KE3HP

The first method of determining G, the universal gravitation constant
(at least 100yrs ago) was by a pair of large weights joined by a horizontal
beam. The beam was suspended by a thin wire. G was determined by the twist
on the wire induced by bringing large weights into proximity to the weights
on the torsion beam.

Modern geological gravitometers measure the deflection of a
cantilevered beam in a sealed tube. The main problems there are the
large zero offset, and adjusting for temperature. Aparently the problems
aren't that large because the gravitometers bounce around in the back of
a truck along with all the other geologists tools of trade, like hammers and
explosives.

The first method of determining G, the universal gravitation constant
(at least 100yrs ago) was by a pair of large weights joined by a horizontal
beam. The beam was suspended by a thin wire. G was determined by the twist
on the wire induced by bringing large weights into proximity to the weights
on the torsion beam.

Modern geological gravitometers measure the deflection of a
cantilevered beam in a sealed tube. The main problems there are the
large zero offset, and adjusting for temperature. Aparently the problems
aren't that large because the gravitometers bounce around in the back of
a truck along with all the other geologists tools of trade, like hammers and
explosives.

Subject: RS-10 ops for WA3NAN special event
To: ham-space@ucsd.edu

[Note: I tried sending this to amsat-bb at 1200 EDT on 19 July. I still haven't seen this in my mailbox, so perhaps amsat-bb is backed up.]

It appears that Pat Kilroy WD8LAQ and I will be operating the NASA Goddard Space Flight Center station WA3NAN for some RS-10 passes on 20 and 21 July. As you may be aware, amateur radio clubs at just about all NASA facilities are participating in the special event to commemorate the Apollo 11 landing.

The rule for frequencies for this event is 11 kHz up from the bottom of the General class portion of the subband. For RS-10, USB ops are traditionally at 29.380 MHz and up. Add 11 kHz and you'll get 29.391 MHz, our chosen downlink frequency. At the beginning of the pass, the uplink frequency will be approximately 145.8928 MHz. In the middle of the pass (no Doppler), the uplink will be approximately 145.8958 MHz. In case of other QSOs or QRM, we'll move up in frequency.

Here are three RS-10 passes we'll make sure to cover. Pat may try to cover some additional passes that occur one orbit before or after the two high-elevation passes. The following list is an OrbiTrack track for Washington, DC. Note that time is Eastern Daylight Time.

For any contacts with WA3NAN _only_, here's QSL info: Domestic stations send a 9" by 12" self-addressed stamped envelope with $0.52 postage to the address below. Canadians need to supply $0.55US (2 IRC) while Mexicans need to supply $0.63US (2 IRC) in postage in addition to the self-addressed envelope.

The WA3NAN address: GARC, PO Box 86, Greenbelt, MD 20768-0086 USA

Please keep in mind that this info is for WA3NAN _only_; see the appropriate bulletins for QSL info for the other NASA club stations.

We'd like to thank the Goddard Amateur Radio Club for allowing us to intrude on their HF operations for these passes. We'd also like to thank GARC once again for allowing us to use their repeater for the weekly Washington-area AMSAT net. Don't forget that these are the same folks who bring you the Shuttle retransmissions!

Hope to work you through RS-10!

73, Walt KE3HP

Subject: Two-Line Orbital Element Set: Space Shuttle
To: ham-space@ucsd.edu

The most current orbital elements from the NORAD two-line element sets are
carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when
possible). Documentation and tracking software are also available on this
system. As a service to the satellite user community, the most current
elements for the current shuttle mission are provided below. The Celestial
BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using

8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation
and software are also available via anonymous ftp from archive.afit.af.mil
(129.92.1.66) in the directory pub/space.

Subject: Two-Line Orbital Element Set: Space Shuttle
To: ham-space@ucsd.edu

The most current orbital elements from the NORAD two-line element sets are
carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when
possible). Documentation and tracking software are also available on this
system. As a service to the satellite user community, the most current

elements for the current shuttle mission are provided below. The Celestial
BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using
8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation
and software are also available via anonymous ftp from archive.afit.af.mil
(129.92.1.66) in the directory pub/space.

Not for communication with the pacsats there isn't, or do you know of a
mac based package that replaces the pb/pg suite? The only way I know
that you can work the pacsats using broadcast/ftl0 protocal with a mac is
with an IBM PC emulator.

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* STS-65 SAREX ACTIVITY *
==========
The Space Shuttle Columbia had a flawless liftoff on 08-Jul-94 at 16:43:00.083 UTC for a 14-day mission in space. Columbia has been assigned Space Command Object Number 23173 and International Designator 1994-039 A.

The Shuttle Amateur Radio Experiment (SAREX) packet robot on board the space shuttle Columbia was activated on 11-Jul-93. The following highly edited text was copied on 12-Jul-94 at WA5ZIB from the STS-65 shuttle mission:

W5RRR-1>QST [07/12/94 17:17:00] :
Hello from KC5HBV and KC5FVF aboard the Space Shuttle Columbia
We're well into our mission now conducting materials processing and life sciences experiments that are paving the way for future operations aboard our international space station. We've talked to schools in Texas, Florida, Hawaii and Germany via SAREX and it's been great.

W5RRR-1>QRZ [07/12/94 17:17:57] :
#623-KE4HJV KE4HSB KJ5BM WD5IWT N5SEM XE2X KA5SFD KB5CXR KF7E KC6WYG WB6LLO K6EXO WA5RTL KA7FNQ KE6BVF KD6BOG N6MZV KD6NEX N7QQ N6HL N6ZHV AA6SF AB6DG WB6FJE W6US KD6VXJ W6NKF KJ9U ZS6BTD ZR3IE ZS1CM ZS6ADS N2QAC AD4HY WA4NRU

W5RRR-1>QSL [07/12/94 17:17:58] :
KB5CXR/717 PY3ADQ/662 PY3SS/647 JA1ZBM/642 7L2CAM/637 PU3VHQ/625 JA1NVB/617 JR5EBL/611 JM1QOP/588 JA2DXY/587 JF1AJE/584 JI7JRX/583 JA3CF/582 JS1MQG/580 TG9IKE/575

W5RRR-1>SAREX [07/12/94 17:17:59] :
This is STS-65 SAREX Robot station W5RRR-1
onboard the Space Shuttle Columbia.

[Info via WA5ZIB]

* GARC SHUTTLE RE-TRANSMISSIONS *
==========
The Goddard Amateur Radio Club (GARC) invites interested people to tune in to STS-65 shuttle ground communications transmissions. As a public service to the Amateur radio community, the GARC retransmits space shuttle air-to-ground communications. During the STS-65 mission which also carries a Shuttle Amateur Radio Experiment (SAREX), Amateur radio operators, shortwave listeners, and individuals with scanners can listen to these communications on the following HF (single sideband) and VHF (FM) frequencies:

3.860 MHz (LSB)
7.186 MHz (LSB)

14.295 MHz (USB)
21.395 MHz (USB)
28.650 MHz (USB)
147.450 MHz (FM) in local Washington D.C. metro area

[Info via Erich Franz Stocker, N3OXM]

* APOLLO ANNIVERSARY SPECIAL EVENTS *
====================================
At least 12 amateur stations associated with the National Aeronautics and Space Administration will be active July 19 to 22 to commemorate the 25th anniversary of humans landing on the moon, on July 20, 1969, on Apollo 11. The operations will begin at 0700 UTC July 19 and end at 0500 UTC July 22, coinciding with the time the Apollo Moon Lander (the Eagle) was on the moon's surface in 1969.

Stations are expected to be on modes including CW, SSB, FM, packet, Pactor, Amtor, RTTY, SSTV, ATV, and amateur satellites. Here are the 12 stations expected to be active:

Ames Amateur Radio Club, NASA Ames Research Center, Moffett Field, California: K6MF (AARC, Box 73, Moffett Field CA 94035-1000).

Dryden Amateur Radio Club, NASA Dryden Flight Research Center, Edwards, California: KF7GD (NASA DFRC, Attn: Dryden ARC, POB 273, Edwards CA 93523).

Goddard Amateur Radio Club, NASA Goddard Space Flight Center, Greenbelt MD: WA3NAN (GARC, PO Box 86, Greenbelt, MD 20768-0086).

Guam Contingency Landing Site Amateur Radio Group: KC4YDP/KH2 (NASA RADIO, Kennedy Space Center FL 32899).

NASA Headquarters Amateur Radio Group, Washington, DC: N4ZR (2003 Sarazen Place, Reston VA 22091-3809).

Jet Propulsion Laboratory Amateur Radio Club and Goldstone Amateur Radio Club, Jet Propulsion Laboratory, Pasadena, California: W6VIO (JPLARC, M/S 168-327, 4800 Oak Grove Dr, Pasadena, CA 91109).

Johnson Space Center Amateur Radio Club, NASA Johnson Space Center, Houston, TX: W5RRR (JSC ARC/W5RRR, Johnson Space Center, Houston TX 77058).

Kennedy Space Center Amateur Radio Group, Kennedy Space Center, Florida: KC4TCV (NASA RADIO, Kennedy Space Center FL 32899).

NASA Lewis Amateur Radio Club (NLARC), NASA Lewis Research Center, Cleveland, Ohio: AK8Y (NASA Lewis Amateur Radio Club, 21000 Brookpark Rd, MS 54-6, Cleveland OH 44135).

Marshall Amateur Radio Club, NASA Marshall Space Flight Center, Huntsville, Alabama: WA4NZD (Marshall Amateur Radio Club, CM21X, MSFC AL 35812).

Stennis Space Center Amateur Radio Club, NASA Stennis Space Center, Mississippi: K5GY (Stennis Space Center Amateur Radio Club, Bldg 1201, Stennis Space Center MS 39529).

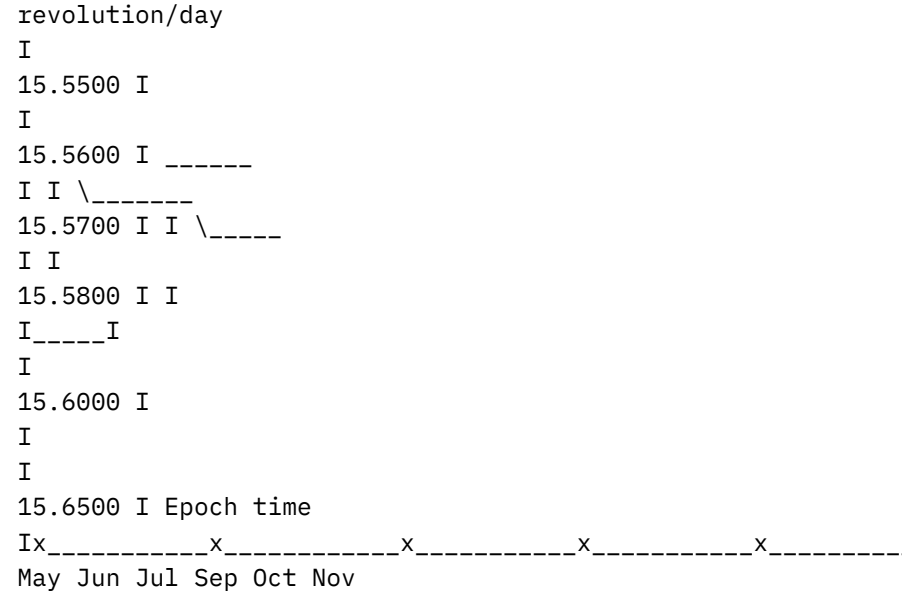
Wallops Island Amateur Radio Club, NASA Wallops Flight Facility, Wallops Island, Virginia: KE3ND (Wallops Island ARC, NASA Wallops Flight Facility, Building E-134, Wallops Island VA 23337).

White Sands Complex Amateur Radio Group, NASA White Sands Test Facility, Las Cruces, New Mexico: KF7E (P.O. Box 627, Organ NM 88052).

[Info via ARRL]

* MIR ORBIT ADJUSTMENTS *
==========
The following graphic depicts the mean motion (which is inversely proportional to mean orbital altitude) of Mir over the past several months:

TIME REVOLUTION (summary) for MIR Complex 16609
(Period= day 130 to day 185 1994)



Orbit adjustments were made on 12-March, 12-May, and on 03-July when Mir docked with the Soyuz TM-19 module.

30 To be launched on need in FY '95

Notes
-----
1. NASA Catalog Number is also known as NORAD or U.S. Space Command object number.
2. No orbital plane position = satellite no longer operational.
3. Clock: Rb = Rubidium; Cs = Cesium
4. S/A had been enabled on Block II satellites during part of 1990; S/A off between about 10 August 1990 and 1 July 1991 due to Gulf crisis; standard level re-implemented on 15 November 1991. Currently, PRN15 and PRN20 appear to have little or no S/A imposed.
5. Anti-spoofing was activated on 94-01-31 at 00:00 UT on all Block II satellites. (ref. NANU 050-94042)
6. PRN number of SVN32 was changed from 32 to 01 on 93-01-28.
7. PRN05 and PRN06 are equipped with corner-cube reflectors for satellite laser ranging (SLR). SLR tracking of the satellites will permit onboard clock errors and satellite ephemeris errors in GPS tracking to be differentiated.
8. The decommissioning date for PRN06/SVN03 is the date of termination of operations of this satellite (ref. USNO) and is about 3 weeks later than the date GPSIC gives for "deactivation".
9. The PRN06/SVN36 launch included the SEDS-2 tether experiment on the Delta II rocket body (object 23028, 1994-016B). The tether was broken by an impact

on 94-03-15. The SEDS-2 end mass subsatellite and about half of the tether
re-entered within a few orbits. 11 km of tether remained attached to
the Delta rocket. The tether was clearly visible to the naked eye and many
sightings were reported. The rocket and remaining tether re-entered on
94-05-08. (ref. Jonathan McDowell)
10. Although its L1/L2 bands were left on, PRN12 was set unusable from 94-06-17
until 94-07-08 due to power supply problems during its eclipse season. (ref.
NANUs 174-94171, 181-94186, 182-94192)
11. PRN13 was boosted to a higher orbit for disposal on 94-06-20 and will not
return to service. The satellite had been unusable since 94-02-27 due to
"end of life testing." (ref. NANUs 083-94059 and 176-94173)

The PowerPC chip has invaded both the DOS and MAC sides of the fray to provide complete and total interchangability. It doesn't matter any more which hardware manufacturer you buy from, as long as there is a PPC inside (sorry, Intel!). Software, both commercial and amateur, now will finally have to stand on its own merits, not those of the hardware or OS on which it is running.

Before either or both of you get upset, let me explain that I am a dual user. My rerrible old MacSE does support both IBM and Mac disk formats, so I can take IBM HD software diskettes and translate them back to DD, which the precious blue PS/2 line can't do. When I network the two machines using MacLink, I can even convert 5 1/4 disks to 3 1/2 of any density in either OS format. The disadvantage is that I have to have two separate and distinct machines on my desk right now, which means I have precious few remaining square inches of desktop. I'll finally be able to reclaim some of that real estate if our department budget and specifically my PowerMac gets approved and fully funded!

We should also realize that most PC users don't/can't access Mac BBSs because their machines and telecom freeware libraries don't support the many functions available (and required) for Mac BBS users. Try First Class if you're serious about wanting a decent screen interface to a BBS; ANSI graphics just don't cut it in the Mac world.

Source record: 27226

LES 9 was built by MIT's Lincoln Labs (hence the designation Lincoln Experimental Satellite). It was launched on March 15, 1976 on a Titan IIIC launch vehicle. Weight was about 454 kgs. It was placed at 8.6 degrees west Longitude in an inclined orbit. International designation was 1976 23B, and NORAD # 8747.

I don't have any information about the satellite's mission (other than the generic communications research and experiments) or how long it operated. LES-9 was launched with its sister satellite LES-8 on the same mission.

I'm not absolutely certain (this is from memory) but I believe that the satellites were nuclear powered.

Philip Chien KC4YER

* The Great Moon Race: The Finish Line - Andrew J. LePage

##############################

ASA MEMBERSHIP INFORMATION

The Electronic Journal of the Astronomical Society of the Atlantic (EJASA) is published monthly by the Astronomical Society of the Atlantic, Incorporated. The ASA is a non-profit organization dedicated to the advancement of amateur and professional astronomy and space exploration, as well as the social and educational needs of its members.

ASA membership application is open to all with an interest in astronomy and space exploration. Members receive the Journal of the ASA (the JASA is a hardcopy sent through United States Mail and is not a duplicate of this Electronic Journal) and the Astronomical League's REFLECTOR magazine. Members may also purchase discount subscriptions to ASTRONOMY and SKY & TELESCOPE magazines.

For information on membership, you may contact the Society at any of the following addresses:

Astronomical Society of the Atlantic (ASA)
P. O. Box 15038
Atlanta, Georgia 30333-9998
U.S.A.

ASA BBS: (404) 321-5904, 300/1200/2400 Baud

or telephone the Society Recording at (404) 636-3642 to leave your address and/or receive the latest Society news.

ASA Officers and Council -

President - Eric Greene
Vice President - Jeff Elledge
Secretary - Tex Ratcliff
Treasurer - Cindy Weaver
Council - Frank Guyton, Larry Klaes, Ingrid Siegert-Tanghe,
John Stauter, Wes Stucky, Harry Taylor, Gary Thompson,
Bob Vickers

ARTICLE SUBMISSIONS

Article submissions to the EJASA on astronomy and space exploration are most welcome. Please send your on-line articles in ASCII format to Larry Klaes, EJASA Editor, at the following net addresses or the above Society addresses:

klaes@mtwain.enet.dec.com
or - ...!decwrl!mtwain.enet.dec.com!klaes
or - klaes%mtwain.dec@decwrl.enet.dec.com
or - klaes%mtwain.enet.dec.com@uunet.uu.net

You may also use the above addresses for EJASA back issue requests, letters to the editor, and ASA membership information.

When sending your article submissions, please be certain to include a network and/or regular mail address where you can be reached, a telephone number, and a brief biographical sketch.

Back issues of the EJASA are also available from the ASA anonymous FTP site at chara.gsu.edu (131.96.5.29). Directory: /ejasa

DISCLAIMER

Submissions are welcome for consideration. Articles submitted, unless otherwise stated, become the property of the Astronomical Society of the Atlantic, Incorporated. THE GREAT MOON RACE: THE FINISH LINE

Copyright (c) 1994 by Andrew J. LePage

The author gives permission to any group or individual wishing to distribute this article, so long as proper credit is given and the article is reproduced in its entirety.

I still remember that hot summer evening twenty-five years ago this month. My parents let me stay up well past my bedtime to watch the earliest historical event that I can remember. I clearly recall watching the television with the image of Mission Control fixed on the screen and listening to Walter Cronkite of CBS-TV News trying to explain to the audience the significance of the cryptic conversations taking place. For what seemed like an eternity I waited; something that any seven year-old finds difficult to do. I had watched the landing that afternoon and knew what was about to happen would be a first. However, having grown up in the Space Age with its steady diet of celestial firsts - and being only seven - I did not fully appreciate the upcoming event's significance.

Finally, just before eleven p.m. Eastern Daylight Time (EDT), the image on the TV changed and a puzzling, ghostly image appeared. At first I could not decipher what I was looking at. Then a faint human figure appeared on the screen. I quickly realized that it was an astronaut making his way down the Lunar Module (LM) ladder - but the image was upside down! After a few moments the picture righted itself. Just minutes before eleven (10:56:20 p.m. EDT, to be exact), a traveler from the planet Earth named Neil Armstrong stepped off the LM foot pad and touched the face of the Moon for the first time.

It was not too long after that I succumbed to the inevitable and fell asleep, missing the events that would follow: A second human named Edwin "Buzz" Aldrin coming down the ladder, the planting of the American flag, the gathering of lunar samples, and more. The United States had won what some at the time believed was a one-sided race to the Moon.

What happened exactly the next day I do not remember. It was just part of the now blurry mosaic of typical events in the life of any kid during a summer vacation in the late Nineteen Sixties in an ordinary New England mill town: Playing with my friends Kevin and Mike, running under the sprinkler to stay cool, building forts in the woods, staying clear of my sister's friend Diane who obviously wanted to kiss me, and occasionally wondering what third grade with Sister Bertha would be like.

Most of the estimated one billion people who watched the previous evening's events, including myself, were unaware of what was then taking place at a different mission control center deep inside the Soviet Union. A large automated spacecraft of unproven design was attempting to make its way to the lunar surface from orbit. The crash of LUNA 15 that afternoon would be just the latest in a string of failures that ultimately denied the Soviet Union their winning a significant piece of the race to the Moon.

It would be several years before I would learn of the events of that day. It would be even more years before I read about the little-known and then mostly rumored string of failures that preceded it. Only with the advent of Peristroika and the subsequent breakup of the Soviet Union in the early 1990s would the bits and pieces of the real story finally start to trickle out from behind the crumbled Iron

Curtain. Although many pieces are still missing, we in the West now know that there was indeed a race to the Moon and how the Soviets tried to either win parts of that race or at the very least upstage the American effort.

The Grand Plan

During the last year that lead up to the APOLLO 11 mission in 1969, the Soviet Union was working frantically on a three-pronged assault on the Moon. The first part of this effort was a program to send a man on a looping trajectory that would make a simple pass by the Moon and return him to Earth. The spacecraft that would perform this mission, known as the L-1, was a six-ton (5,600-kilogram) vehicle based on the SOYUZ design, whose descendant is still used today to ferry crews to and from Russia's MIR Earth-orbiting space station.

From the outside, the L-1 looked like the three-part SOYUZ but lacked its spherical orbital module. Other major differences were less obvious, including a modified propulsion system, a beefed up heat shield, long-distance communication systems, and more. The spacecraft was well-suited for its simple mission to carry a lone cosmonaut on a week-long circumlunar mission. A successful mission before the American Moon landing would allow the Soviets to claim that they were the first to send a human to the Moon.

Previous tests of the L-1 were less than successful. First they were plagued by failures of the then-new PROTON launch vehicle. The first mission to make it beyond Earth parking orbit, ZOND 4, was launched in early March of 1968. To avoid unnecessary complications, ZOND 4 was aimed directly away from the trajectory-distorting influences of the Moon and its rather lumpy gravitational field. The mission was simply to test the L-1 spacecraft at lunar distances, especially the all-important communications system.

During the six days following launch, cosmonauts in a bunker on Earth spoke to mission controllers through a relay transmitter on board the spacecraft to test these systems. Upon return from cislunar space, ZOND 4 was to make a relatively low-G, double-skip entry and land in Soviet territory. Then, just before this complicated maneuver, the probe's astro-orientation system failed, forcing the descent module to make a simple ballistic entry into Earth's atmosphere. With the quickly descending probe coming down over the Gulf of Guinea off the coast of Africa, far from any Soviet recovery ship, the spacecraft was deliberately blown up to prevent it from falling into the hands of American intelligence.

The next attempt to test the L-1 was scheduled for July 21, 1968. With the American manned lunar program on the verge of shifting into overdrive, Soviet officials needed to launch this L-1 towards the Moon in a full test of the circumlunar mission. On board were a number of biological specimens to assess the effects of exposure to the near-lunar environment, a photographic system to take high-quality

images of the lunar surface as the spacecraft passed the Moon, and, like ZOND 4, equipment to perform long-distance voice communication tests. Before the launch, a crack was discovered in the Block D escape stage of the PROTON, forcing the removal of the launch vehicle from the pad for repairs. Two months later, ZOND 5 was finally launched on September 15 and successfully sent towards the Moon.

Three days after launch, ZOND 5 made its single close pass of the Moon at a minimum distance of 1,210 miles (1,950 kilometers). Its precisely tailored trajectory then allowed the spacecraft to return to Earth without any major propulsive maneuvers. Unfortunately, failure struck just before entry into Earth's atmosphere. Again the astro-orientation system ceased to function properly and the descent module was forced to make a punishing high-G ballistic entry. This time, however, a Soviet tracking ship named the VASILY GOLOVIN was stationed under the path of ZOND 5 and was able to recover the wayward spacecraft after its splashdown in the Indian Ocean.

By this time, the Central Intelligence Agency (CIA) had informed NASA decision makers of the Soviet Union's intent to fly a manned circumlunar mission soon. With the successful Earth orbit mission of APOLLO 7 in October, the APOLLO Command and Service Modules (CSM) were deemed ready for a lunar mission. However, with the ground testing of the LM months behind schedule, there was no way for the Americans to mount a previously planned lunar orbit test of the LM to beat the Soviets. Instead, it was decided that only the CSM would be launched on a lunar orbit mission in late December. The race to be first *around* the Moon, if not actually landing on it yet, was on.

With the L-1 yet to perform successfully, Soviet engineers knew they needed at least one good end-to-end test of their circumlunar spacecraft before committing to a manned flight. The memory of the failure of SOYUZ 1 in 1967 with its then less-than-proven design and the loss of its pilot Vladimir Komarov was still fresh in the minds of everyone involved. Another test, ZOND 6, was launched on November 10. This would be the last chance to test the L-1 on its circumlunar mission and still mount a manned L-1 mission before the Americans launched APOLLO 8.

The mission of ZOND 6 was virtually identical to its predecessor. Three days after launch, the probe swung to within 1,500 miles (2,420 kilometers) of the lunar surface and began its long fall back towards Earth. Unlike the previous pair of tests, the L-1 astro-orientation system functioned properly and ZOND 6 successfully executed a double-skip entry, thus assuring a landing in Soviet territory. But the return to Earth would prove to be less than perfect. The parachute deployed prematurely and the landing capsule crashed. If it had been manned, ZOND's occupant would have been killed. While the Soviets publicly hailed the mission as a success, it was yet another blow to their lunar program.

As the December 7 launch window was approaching, a heated debate was taking place whether to commit a man to the next L-1 launch. The cosmonauts training for the mission wrote to the Politburo, stating that they were prepared to take the risk and argued that the mission would have a better chance at success with a man on board to take over in case of another automated system failure. It is rumored that a crew was chosen and that a cosmonaut would fly on this last mission before the upcoming launch of the American APOLLO 8.

After the PROTON with its L-1 was rolled out onto the pad, a series of problems with the launch vehicle arose. Before the problems could be fixed, the launch window closed and the Soviets' last chance to be first to the Moon was lost. The mission of APOLLO 8, which entered lunar orbit on Christmas Eve of 1968 with three Americans on board, was a success. American astronauts, not a Soviet cosmonaut, were the first to visit the Moon.

The following month, the now repaired launch vehicle was rolled out onto the pad for another unmanned test of the L-1. A human passenger would not be risked this time, since there was not a space first at stake any longer. The spacecraft was launched unmanned. During ascent to Earth parking orbit, the launch vehicle exploded upon ignition of the PROTON's second stage. The fact that the launch escape system also failed to operate must have sent a chill through the ranks of the cosmonauts training for the L-1 mission. If a cosmonaut was on board, he would have surely perished. While work on the L-1 circumlunar missions continued, it was realized that its passengers would not be the first to the Moon. Still, these flights would be valuable in support of the second prong of the Soviet Union's lunar assault.

The Long Shot

The second prong of the Soviet assault on the Moon was an actual manned landing on the lunar surface. During 1968, it became clear to Soviet leaders that a manned landing by a Russian cosmonaut would not occur until 1970 or 1971 at the earliest. Delays in the development of the Soviet Moon rocket, the N-1, made an earlier date unlikely. Delays in the design and testing of the Lunar Orbiter Cabin (LOK), and especially the Lunar Cabin (LK) that would make the descent to the surface, made it impossible. Nonetheless, the program schedule was pushed to the limit in hopes that the American APOLLO program might somehow falter, affording the Soviets the opportunity to overtake them in the next year or so.

The first and largest component ready for testing would be the N-1 Moon rocket itself. On November 25, 1967, a mockup of the N-1 was installed on launch pad Number 1 for seventeen days of electrical tests. The first flight-ready launch vehicle was erected on the same pad on May 7, 1968, in preparation for a test launch. The booster had to be returned to the assembly building, however, after cracks were found in the first stage structure, possibly caused by the attachment of the payload.

After months of assessment and repairs, this vehicle was again placed on the launch pad in November, only to be replaced with another mockup for further tests and launch team training. Finally, in mid-January of 1969, N-1 Number 3L was erected on the pad with its payload for its first test flight. The test would be risky since, to save time and money, the large cluster of first-stage engines was never tested as a group.

Since neither the LOK nor LK were ready for a test flight at that time, the Soviets used a modified L-1 known as the L-1S as the vehicle's primary payload. The N-1 would place the L-1S and a dummy LK on a trajectory towards the Moon. Once there, the L-1S alone would enter lunar orbit to take high-resolution photographs of proposed landing sites and then return to Earth with the exposed film. For the mission, an Orientation Engine Module (DOK) would be attached to the front of the basic L-1. The DOK would slow the L-1S enough to place it into lunar orbit, after which it would be jettisoned. The L-1S would then use its own propulsion system, located in the Instrument Module, to accelerate out of lunar orbit for the return to Earth. The spacecraft would perform a double-skip entry as in previous L-1 flights as a test of the nearly identical LOK Descent Module.

After 28 days of on-pad preparations and an additional one-day weather delay, the first N-1 lifted off into clear skies on February 21, 1969. Seconds after launch trouble began. Two of the first stage's thirty NK-33 engines shut down due to a problem with the KORD control system which guided the mammoth rocket. The launch vehicle was designed to operate with as many as four first-stage engines shut down, so the flight continued with the other engines compensating for the loss. Twenty-five seconds after launch, the engines were throttled back as programmed as the N-1 passed through maximum dynamic pressure, or max-q.

About 65 seconds into the flight, the engines were throttled back up to full power. At this point the lack of adequate testing of this Space Age leviathan became apparent. The engines throttled up more quickly than expected, causing stronger than planned vibrations. A liquid oxygen pipeline burst and started a fire in the engine compartment before the KORD could shut down the affected engine. The surrounding engines and turbopumps quickly overheated and exploded.

After seventy seconds of flight, the KORD finally shut down all engines and the launch escape system was activated. The L-1S capsule was recovered 20 to 22 miles (32 to 35 kilometers) downrange. The now powerless N-1 slammed into the Kazhak steppes and exploded some 30 miles (48 kilometers) from its launch pad.

Undeterred by this first failure, a second N-1 was modified and prepared for launch. With the successful tests of the American LM in Earth orbit during the APOLLO 9 mission in March and the test in lunar orbit by APOLLO 10 in May, only a failure of the APOLLO 11 mission and a successful N-1 test would leave the Soviets with any chance of landing a man on the Moon first.

By mid-1969, the second N-1 launch pad was ready and a mockup installed for fitting and electrical tests. Finally, on July 3, the second N-1, Number 5L, took off from pad Number 1 with another L-1S as its primary payload. It immediately encountered problems when debris in the oxidizer tank was ingested by one of the first-stage engines, causing its turbopump to explode. This explosion caused a second engine to fail, which in turn caused a chain reaction, eliminating several neighboring engines as well as damaging the KORD's electrical control system.

The launch escape system was automatically activated, pulling yet another L-1S descent module away from an N-1. The capsule came down about one-half mile (one kilometer) from the pad, while the fully fueled N-1 crashed into its launch pad eighteen seconds after launch. The impact destroyed the rocket, pad Number 1, and heavily damaged the newly completed pad Number 2.

The N-1 was in desperate need of modification. Almost two years of launch pad reconstruction would be needed before the Moon rocket could be flown again. With their hopes to beat the Americans to a manned Moon landing surely dashed, the Soviets had only one last card to play.

The Ace in the Hole

The last prong of the Soviets' plan to beat the Americans to the Moon did not involve a manned spacecraft at all. As part of a long-term plan to explore the Moon, designers at the Babakin Design Bureau had come up with plans for unmanned lunar landers, rovers, and orbiters somewhat similar in size and mission to the long-abandoned American PROSPECTOR program. The exact origin and original mission for this family of spacecraft is still unknown, but it was likely meant to be used as a manned mission pathfinder.

At this point in history, though, one of the proposed missions could have been to undermine the scientific justification for the manned APOLLO missions. By March of 1969, the Soviets publicly admitted to planning an unmanned lunar sample return mission. The major selling point of this program was that an unmanned spacecraft could return samples of the lunar surface for a fraction of the cost of a manned mission and at no risk to a human crew. It would be a major coup if the Soviets could do this before an American manned landing and could totally undermine political support in America for any manned lunar mission if one of the early APOLLO test missions or the first manned landing attempt had failed.

With the real possibility of stealing some of APOLLO's thunder, the first launch of this six-ton (5,700-kilogram) sample return spacecraft took place on April 15, 1969. It never got far since its PROTON booster was rumored to have exploded on the launch pad. A second attempt on June 14 made it as far as the ignition of the PROTON's second-stage, at which point it exploded.

Since March, tensions between the Soviets and Chinese had erupted almost to the point of war, with several skirmishes taking place along their common border. During this time an unusually large number of Soviet photoreconnaissance satellites were launched to observe Chinese troop movements. With this heightened sense of alert, one cannot help but wonder if such 'unimportant' flights as a lunar mission got the short end of the stick when it came to obtaining resources for launch preparations.

There was only one last chance to beat the Americans and get samples of the Moon back to Earth before the APOLLO 11 mission. On July 13, 1969, just three days before the launch of APOLLO 11, LUNA 15 went into a trajectory towards the Moon. After a trajectory correction maneuver the day after launch, LUNA 15 fired its rockets again on July 17, entering a 34 by 126-mile (55 by 203-kilometer) lunar orbit with APOLLO 11 just two days behind it. On the day APOLLO 11 entered lunar orbit, LUNA 15 altered its orbit to 5.6 by 137 miles (9 by 203 kilometers), inclined 126 degrees to the lunar equator. At this point there were worries in the U.S. that LUNA 15 would somehow interfere with the manned APOLLO mission. Assurances were quickly given by the Soviets that this would not be the case and both missions continued.

On July 20, only hours before the scheduled landing of APOLLO 11, LUNA 15 made yet another orbital change, resulting in a 10 by 68-mile (16 by 110-kilometer) orbit inclined 127 degrees. It was not until the next day, after astronauts Neil Armstrong and Edwin Aldrin had already landed their Lunar Module named EAGLE on Mare Tranquilitas - the Sea of Tranquility - and walked on the Moon, that LUNA 15 made its last retrorocket burn and began its descent to the lunar surface. Unfortunately, the lander crashed at a speed of 300 miles per hour (480 kilometers per hour) at 17 degrees north, 60 degrees east in Mare Crisium, the Sea of Crises. The Soviets simply announced that LUNA 15 had completed its mission and left it at that. It would be almost twenty years before it was officially admitted that LUNA 15 was a failed sample return attempt.

Even if LUNA 15 had succeeded at this landing attempt, it would not have returned until the day after the return of APOLLO 11 on July 24. This mission did spend one day longer in lunar orbit than was typical of later sample missions, making it possible that there were some problems with the spacecraft or tracking it or accurately predicting its orbit. If LUNA 15 had made it down in three days instead of four, or if the APOLLO 11 mission had failed to return samples, the Soviets would have had their space first. Instead, the Soviets had several tons of wreckage on the lunar surface and at best a brief blurb in Western newspapers buried several pages behind the news of the successful mission of APOLLO 11.

Postscript

Even after the failure to beat the Americans to the Moon, the Soviets continued through 1969 with their lunar missions. On August

8, 1969, the Soviets successfully launched an L-1 spacecraft on another unmanned circumlunar flight. ZOND 7 flew by the Moon, coming to within 1,200 miles (2,000 kilometers) of the surface three days after launch. On August 14 the latest L-1's descent module executed a perfect entry and landing, making it the first totally successful flight of the L-1 design.

Plans at that time called for another unmanned flight in December. The first manned L-1 circumlunar flight would then be launched in April of 1970 to coincide with the one hundredth anniversary of the birth of Vladimir Ilyich Lenin (1870-1924), the leader of the Russian Revolution in 1917. Electrical tests of the last unmanned L-1 spacecraft took place between September and November of 1969, but the L-1 manned program was postponed and finally scrapped, possibly because of the success of the second American lunar landing, APOLLO 12, in November.

Sample return mission attempts also continued in 1969, but with less success. A mission launched on September 23 got stranded in its Earth parking orbit when the PROTON's Block D escape stage failed to operate properly. This attempt received the generic Soviet moniker of KOSMOS 300. Another attempt launched on October 22 suffered a similar fate and was designated KOSMOS 305 after it failed to leave Earth orbit. Unlike the L-1 program, however, the Soviets would continue with their unmanned lunar program into 1970 and beyond, advertising it as the preferred, cheaper, and safer means to explore the Moon. It was hoped that 1970 would be luckier for the Soviets than the previous two years.

Summary of Lunar Missions: Second Half 1968 to 1969

Name Launch Country Weight Launch Vehicle
Date lbs (kg)

ZOND 5 Sep 14, 1968 USSR 12,300 (5600) ? PROTON
Partially successful unmanned L-1 circumlunar test

ZOND 6 Nov 10, 1968 USSR 12,300 (5600) ? PROTON
Partially successful unmanned L-1 circumlunar test

APOLLO 8 Dec 21, 1968 US 63,631 (28,897) SATURN V
First manned lunar orbiter

(Unannounced) Jan 19, 1969 ? USSR 12,300 (5600) ? PROTON
Possible launch failure of unmanned L-1 circumlunar test

(Unannounced) Feb 21, 1969 USSR 15,000 (7000) ? N-1
Unsuccessful test of N-1 carrying L-1S photographic lunar orbiter

(Unannounced) Apr 15, 1969 USSR 12,600 (5700) ? PROTON
Launch failure of sample return attempt

APOLLO 10 May 18, 1969 US 94,325 (42,836) SATURN V
Second manned lunar orbiter and test of LM

(Unannounced) Jun 14, 1969 USSR 12,600 (5700) ? PROTON
Launch failure of sample return attempt

(Unannounced) Jul 3, 1969 USSR 15,000 (7000) ? N-1
Unsuccessful test of N-1 carrying L-1S photographic
lunar orbiter

LUNA 15 Jul 13, 1969 USSR 12,600 (5700) ? PROTON
Unsuccessful lunar sample return attempt

APOLLO 11 Jul 16, 1969 US 96,584 (43,862) SATURN V
First manned lunar landing

ZOND 7 Aug 7, 1969 USSR 12,300 (5600) ? PROTON
Unmanned L-1 circumlunar test

KOSMOS 300 Sep 23, 1969 USSR 12,600 (5700) ? PROTON
Unsuccessful lunar sample return attempt

KOSMOS 305 Oct 22, 1969 USSR 12,600 (5700) ? PROTON
Unsuccessful lunar sample return attempt

APOLLO 12 Nov 14, 1969 US 96,681 (43,906) SATURN V
Second manned lunar landing

1119. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1994-07-20 21:10:06 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.774738606@afit.af.mil>
Source record: 27222

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1121. Downlink signal

Newsgroup: rec.radio.amateur.space
Date: 1994-07-20 23:45:38 UTC
From: Gary_Rogers@DGC.ceo.dg.COM
Message-ID: <9407210045.AK00034@rtp41.rtp.dg.com>
Source record: 27221

Message:
Does anyone have any ideas about a problem I seem to have? My
downlink signals seem to have a buzz as if there was bad filtering in
the power supply of my transmitter. Last night I had a local ham
meet me on 144.200 and he says the signal sounds fine. The equipment
here is an IC-251A and Mirage amp for uplink and an TS-690S for
recieve. The noise is there whether the amp is on or not. I noticed
the same thing on the FO-20 downlink yesterday but didn't hear it
today, so it isn't the reciever. The problem originally came up when
operating RS-10. Any ideas or other input welcome.

Thanks in advance.

Gary WA4YMZ Gary Rogers@dgc.ceo.dg.com

The opinions I express are mine alone. Data General doesn't want them
and I change them from time to time anyway.

1122. CONNECTING THREE MODEMS

Newsgroup: rec.radio.amateur.space
Date: 1994-07-21 00:17:40 UTC
From: Gary_Rogers@DGC.ceo.dg.COM
Message-ID: <9407210117.AC00038@rtp41.rtp.dg.com>
Source record: 27223

Message:
I'm cross-posting to Digital and Space because my questions concern both, so a lot of people will see this twice.

I recently purchased a PacComm PSK-1 satellite modem and last Saturday I purchased the PacComm TNC-NB96 (to celebrate getting my Advanced and passing the Extra written cold, but that's another story). Now I have to figure how to connect everything together. My primary use will be the satellites, both PSK and 9600 FM, but I'm sure I'll do some local stuff, too, now that I'm equiped. The 2M rig is an old Icom IC-251A and the satellite receiver is a Down East Microwave transverter/Kenwood TS-670 combination. Reading through the literature, it looks like I'll be making a LOT of connections. If anyone has any experience with a similar setup or can offer suggestions, please pass them along. What I need to know are things like: 1) Will I have to have separate taps for xmit and rcv for each mode? 2) Can I use some sort of switch box or relay scheme to route the signals or will I be constantly plugging and unplugging? 3) Can I use my direct connections for 9600 FSK for 1200 AFSK? Has anyone else got experience with the PacComm setup? Any suggestions for a good terminal program? Please post here. Thanks in advance. Gary WA4YMZ

1126. Hamcom22 program problem

Newsgroup: rec.radio.amateur.space
Date: 1994-07-21 10:57:46 UTC
From: ken@fstop.csc.ti.com
Message-ID: <940721105746@ken_durham.sc.ti.com>
Source record: 27232

Hamcom20 and Hamcom22 (which were downloaded from a bulletin board) don't seem to recognize data at the com port. The op-amp interface used works ok with Hffax and is the same as the one described in the txt file for Hamcom. There is no signal on the tuning scope display. No port designation or definition in the config file seems to help.

Does anyone have a working Hamcom program? I would like to be able to use this to copy the RTTY from AO-13 rfor the schedule information.

Any ideas?

Thanks, Ken K5MBV 214-997-3434

SB SAREX @ AMSAT $STS-65.018
Packet Metabeacons from Shuttle

Greenbelt, MD July 21, 1994 at 12:30 UTC

The following is a compilation of some of the packet radio metabeacons copied from the crew on the Space Shuttle Columbia. These were provided by Gil Carman, WA5NOM, and Andy MacAllister, WA5ZIB. The SAREX working group would like to extend its thanks all of you who have provided us feedback and downlink updates of the packet system during the STS-65 mission.

W5RRR-1>QST [07/12/94 17:17:00] :
Hello from KC5HBV and KC5FVF aboard the Space Shuttle Columbia
We're well into our mission now conducting materials processing and
life sciences experiments that are paving the way for future operations
aboard our international space station
We've talked to schools in Texas, Florida, Hawaii and Germany via SAREX
and it's been great

17-Jul-94 11:33:16 W5RRR-1*>QST :

Hello from KC5HBV and KC5FVF aboard the Space Shuttle Columbia
We're half way into our mission now conducting materials processing and
life sciences experiments that are paving the way for future operations
aboard our international space station
We've talked to schools in Texas, Florida, Hawaii, Louisiana Germany and
Japan via Sarex and really enjoyed their enthusiasm for space exploration
and amateur radio
Wishing you all the best on the upcoming 25th anniversary of humankinds
first steps on the Moon

20-Jul-94 10:21:27 W5RRR-1*>QST :
Greetings from the SAREX station aboard the space shuttle Columbia.
The crew of Columbia is privileged and honored on this 25th anniversary
of one of humankind's greatest achievements to follow in the footsteps
of our craft's namesake, the command module Columbia, which carried
Neil Armstrong, Buzz Aldrin and Michael Collins to the moon. We wish all of
you back on earth who are celebrating this historic anniversary our best
wishes and hope that the one small step for a man taken 25 years ago, will
be a giant leap for people of vision as we go on to International Space Station
and beyond.

21-Jul-94 12:01:17 W5RRR-1*>QST :
With the conclusion of this most successful mission, we wish everyone

on earth the very best and thank you for your support,
KC5HBV, KC5FVF and the rest of the STS-65 Crew.

21-Jul-94 12:02:17 W5RRR-1*>QRZ :

SB SAREX @ AMSAT $STS-65.019
SAREX Keps/Plasma Trail

Plasma Trail/Shuttle Reentry

People in the southern U.S. should have a very good view of the Space Shuttle entry plasma trail Friday morning. The prime deorbit opportunity is still on rev 219, which will land at KSC about 10 minutes after sunrise there, and pass over Houston, over College Station and Huntsville at 10:31 UTC, an hour before local sunrise. That should give a plasma arc across the sky with a peak of about 15 deg as seen from Houston. Shuttle landing is planned for 10:39 UTC at the Kennedy Space Center. Keep your eyes peeled!

[info provided by Gil Carman, WA5NOM]

SAREX Keplerian Elements

The following is the official SAREX orbital elements for today. These were generated by Ron Parise, WA4SIR, at the Goddard Space Flight Center, and adjusted to improve the drag term by Gil Carman, WA5NOM, of the Johnson Space Center.

STS-65
1 23173U 94039A 94202.29299650 0.00060047 00000-0 23046-3 0 457
2 23173 28.4656 273.5071 0003567 85.8991 274.2028 15.91315128 2020

Satellite: STS-65
Catalog number: 23173
Epoch time: 94202.29299650 (21 JUL 94 07:01:54.90 UTC)
Element set: GSFC-045a
Inclination: 28.4656 deg
RA of node: 273.5071 deg Space Shuttle Flight STS-65
Eccentricity: 0.0003567 Keplerian Elements
Arg of perigee: 85.8991 deg
Mean anomaly: 274.2028 deg
Mean motion: 15.91315128 rev/day Semi-major Axis: 6676.7339 Km
Decay rate: 6.0047E-04 rev/day*2 Apogee Alt: 300.73 Km
Epoch rev: 202 Perigee Alt: 295.96 Km

NOTE - This element set is based on NORAD element set # 045.
The spacecraft has been propagated to the next ascending
node, and the orbit number has been adjusted to bring it
into agreement with the NASA numbering convention.

> adjustments?

Yes. Not much, but some. The solar wind and light pressure also "blow"
satellites around a bit. The amount of maneuvering fuel is the prime limit
to the lifetime of a geosynchronous satellite.

>2. Is there a laboratory instrument that shows/measures the attraction
> force between objects? If so, how does it work?

Yes. It's called a spring scale. It works by measuring the compression
or stretching of a spring. You probably have one in your bathroom.

Seriously, any instrument that measures gravitational forces is some kind
of spring scale. Most work by indicating the deflection caused by the
weight of a known mass. Some are fancier, measuring the electrical
current required to cause a magnetic field to counteract the deflection.

Ok I'll try this again.

Yes there is a version of the broadcast protocal for the Mac, funnily enough
it's called "Broadcast." I have version 2 and it was written by IW2CTJ.

Ther are also several very good sat predication programmes for the Mac.
Personally I use OrbiTrack.

Hope this helps.

Sean.

1132. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1994-07-21 21:25:16 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.774825916@afit.af.mil>
Source record: 27233

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Being a mac user interested in getting into sats and just new on Internet,
I am interested by your list. And if you could point out some of the sites
where I could FTP the packages, that would be of great help. Thank you very
much for this.

A Washington, DC local, Gilbert Macklin (not a ham, but a satellite
enthusiast, nonetheless) wrote a PB implementation for the Mac. He left
the area for New Mexico, but was planning to continue the work. HE was
working with Jim White, WD0E, so you might want to contact Jim for the
latest news (he can be reached at wd0e@amsat.org).

Source record: 27239

I had similar problems->to avoid them i installed four diodes instead of two, and some electrolytic capacitors...hamcomm needs a bridge rectifier, but for example jvfax doesnt, polarity doesnt change when running the program...i think there is version 3.0 hamcomm available today on ftp.funet.fi

1144. Moonbounce

Newsgroup: rec.radio.amateur.space
Date: 1994-07-22 18:16:57 UTC
From: laplante@unirsvl.rsvl.unisys.com
Message-ID: <CtCtGA.I1r@unirsvl.rsvl.unisys.com>
Source record: 27247
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.space

Has anyone played around with using RTTY for moonbounce? I understand that standard RTTY requires even better s/n ratios than SSB, which doesn't bode well for sucessful EME, but since the standard shift is only 170Hz it seems that RTTY could be crammed into a much narrower band-width, which would help (although it would limit the baud rate!).

It seems that with a syncronous transmission (rather than sync on a character basis) combined with a BCC for error correction, and multiple transmissions of the same message might give a smart (read PC) recieving TTY a chance at successful decoding in spite of very marginal s/n conditions.

Any interest? Any hope?

Bryan LaPlante KB0OBT

Francois,

I have in the last few days uploaded my entire library of Mac software into a
new Mac Ham software FTP area, details are,

ftp.demon.co.uk /pub/ham/mac

You should find a few things in there to get you started, other places to look
are,

joker.optics.rochester.edu (/ham)
sumex-aim.stanford.edu (/info-mac/app)
mac.archive.umich.edu various locations
uxc.cso.uiuc.edu (/pub/ham-radio)
ucsd.edu (/hamradio) many different subdirectories
(/hamradio/packet/tcp/incoming) newest
files temp holding area
(/hamradio/packet/tcpip/pa2aga)
NET/Mac & IM/Mac area
ftp.apple.com (/pub/ham-radio)
akutaktak.andrew.cmu.edu (/aw0g)
softkiss-mac nic.switch.ch (/software/mac/ham-radio)
oak.oakland.edu (/pub/hamradio/mac)

Thanks to Terry Stader - KA8SCP and Patty Winter - N6BIS for the above
information.

Regards,

Sean.

SB NEWS @ AMSAT $SPC0725
* SpaceNews 25-Jul-94 *

BID: $SPC0725

=========
SpaceNews
=========

MONDAY JULY 25, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* LUSAT NEWS *
==============
The LUSAT-OSCAR-19 satellite continues to operate without its file server running. The satellite continues to transmit the following beacon:

LUSAT-1>AMARG <UI>:
May 21.
OBC crashed on May 17 at +/- 2:45 utc, lat 45s, lon 43 w.
Only digipeater is available.

Although the file server is not available, the satellite does function as a digipeater, and other ground stations can be connected point to point, via LUSAT-1. The satellite has uplinks on 145.840, 145.860, 145.880, and 145.900 MHz using 1200 bps AX.25 Manchester encoded FSK. The BPSK downlink is on a frequency of 437.135 MHz.

Binary telemetry transmissions made by LUSAT-1 indicate that the spacecraft is in good health and transmitting with an output power of a little more than one watt.

Frank, KB2MVN in East Chatham, New York is making available his packet mailbox via LUSAT-1. Stations on the east coast of North America can connect to the mailbox when under a common footprint with Frank using a regular terminal program by issuing the command:

c kb2mvn v lusat-1

Monitor LUSAT's beacon to determine if the mailbox is active and accessible from your ground station location. Frank asks that you leave him a message if you are able to access the mailbox.

[Info via LU2BDT and KB2MVN]

* STS-65 SAREX INFO *
=====================
Greg LaBorde, KD6MSM, at the Jet Propulsion Laboratory in Pasadena, California pointed out that some of the callsigns that appeared in the STS-65 SAREX packet frames in last week's issue of SpaceNews were actually those of DX Packet Clusters and their users. This is apparently the result of frequency sharing between the K6EXO DX Cluster in Los Angeles, California and the SAREX package on the Space Shuttle Columbia.

Joe, WA2GSY, in New Jersey provided the following packet frame received from the Space Shuttle Columbia on 21-Jul-94 at 10:26:16 UTC:

W5RRR-1>QST <UI>:
With the conclusion of this most successful mission, we wish everyone on earth the very best and thank you for your support,
KC5HBV, KC5FVF and the rest of the STS-65 Crew.

* KD2BD PACSAT MODEM *
======================
The August 1994 issue of QEX magazine will carry an article describing the "KD2BD Pacsat Modem", a high-performance 1200 bps BPSK modem designed for communication with "Pacsat" satellites. QEX is an experimenter's journal published by the American Radio Relay League.

The KD2BD Pacsat Modem is the result of several years of development and testing. It was designed around commonly available components for easy duplication and provides outstanding performance.

Among the modem's strengths is its ability to successfully decode BPSK signals well into the noise level using correlation decoding techniques. The modem can be used for communication with PACSAT, WEBERSAT, LUSAT, FO-20, and ITAMSAT as well as many future digital store-and-forward amateur communication satellites. It can also be used for weak signal terrestrial packet radio communications.

In operation, the modem demodulates binary phase shift keying signals received from the downlink of a digital amateur communications satellite via a 70-cm SSB receiver and antenna system. A digital AFC circuit in the modem automatically adjusts the receiver tuning in response to Doppler shift. The modem also generates a Manchester encoded serial data stream that when fed into the microphone connector of a 2-meter FM transmitter, produces 1200 bps Manchester encoded FSK suitable for establishing a full duplex digital communications link with Pacsat satellites.

Schematics, photographs, and a discussion of the modem design and its operation are included in the article. As evidence of its performance, a copy of this issue of SpaceNews has been uploaded to the AMSAT-OSCAR-16 microsat using the KD2BD Pacsat Modem, and will remain available for the next several days.

* AMSAT-OSCAR-21 NEWS *
=======================
At 16:17:43 EDT (20:17:43 UTC), Sunday afternoon, July 20, 1969, astronaut Neil A. Armstrong spoke the words:

"Houston, Tranquility Base here. The Eagle has landed."

At 20:56 EDT, later the same day, Armstrong stepped down from the ladder of the Lunar Module onto the Moon's surface and said:

"That's one small step for (a) man, one giant leap for mankind."

Edwin Aldrin followed him about 15 Minutes later, while Michael Collins orbited the Moon with the APOLLO-11 Command and Service Module at an altitude of 100 kilometers.

To commemorate the anniversary of this historic event, a special Multi-Media Broadcast has been uploaded into the RUDAK system on the AMSAT-OSCAR-21 satellite that includes the historic words and the APOLLO-11 logo in APT FAX format.

AMSAT-OSCAR-21's RUDAK downlink is a frequency of 145.987 MHz and can be received anywhere in the world using a narrowband FM receiver when the satellite is above the local horizon.

[Info via Peter, DB2OS, on behalf of AMSAT-DL and AMSAT-Russia]

* JUPITER OBSERVATIONS *
==========
Amateur astronomer Syl Pauley, K1ZFN, in Warwick, Rhode Island observed the remanants of two comet "hits" into the planet Jupiter using his 13.1-inch reflecting telescope (Dobsonian) and a 4 mm eyepiece. The holes created in the Jovian atmosphere were readily observable by him and interested neighbors. Observations were made at approximately 9:30 PM EDT on 19-Jul-94.

Syl would like to hear of any other reports from observations made by others using small telescopes. Syl can be reached via his packet radio address: K1ZFN @ KC1CE.

[Info via Syl, K1ZFN]

* SSTV ON OSCAR 13 *
==========
Slow scan television (SSTV) enthusiats are invited to join the SSTV sessions being carried on the AMSAT-OSCAR-13 satellite on a downlink frequency of 145.955 MHz.

The SSTV net meets at 45 minutes before the Mode S transponder is activated, and on Mode B following Mode S sessions on Saturdays and Sundays. Comments on these nets should be directed to wb6llo@amsat.org who is coordinating the SSTV nets on AO-13.

[Info via Dave Guimont]

>
Well,NOAA is FM and you may be able to fab a demod.But
your IF bandwidth is likely too narrow since you'll need
about 30 - 40 kHz.I suggest to check this first before
spending any $$.
Good luck.

I have just finished building a TB pcb (SM0TER/JA6FTL design) and seem to have lost one of the "special" ic's ..PST 532 battery monitor.
I got the kit from AMSAT-UK but they dont carry any spares and its not listed in any of the major UK catalogs. Does anyone know of a mail order source for this chip that deals in small orders ie "one".

I gather that TAPR also supply this kit, has anyone got an E mail contact address and do the supply spares.

Any info would be appreciated.

Hi Bryan,
I've been playing with unproto Pactor on Oscar 13. Pactor FEC has the
advantage that you can set the number of repeats to a max of 6 or 7 so
even though the throughput goes way down the message can still get
through uncorrupted. Amtor FEC would work too but not nearly as well.
Via EME would be quite a challenge but between two reasonably well
equipped stations it should do OK. I'll be on EME this winter but
my station will fall into the "marginal" category so I don't expect
to be working much ssb & rtty.
Good luck,
John - VE8EV

Source record: 27111

I heard an unusual message transmitted by AO-21 on a short, low elevation pass this weekend, on the 70cm - 2m FM translator output.

It was unmistakable - Neil Armstrongs immortal words "One small step for (a) man, one giant leap for mankind."

Then the satellite went below the horizon and the signal faded into the noise.

Was this to mark the 25th anniversary of the moon landing or was someone in VK playing tricks?

If the former, then the audio must have been digitally encoded and sent to the satellite for playback - another amazing function of the onboard DSP.

Anyone else hear this? Any Comments?

David VK3JKP

Phase-3D Spaceframe Arrives In Florida

Following its completion at the Center for Aerospace Technology at Weber State University in Ogdon, Utah, the Phase-3D spaceframe arrived Monday, July 18th at the AMSAT Phase-3D Integration Facility now established at the Orlando International Airport. It now resides in the clean room which has just been completed at the facility.

Dick Jansson (WD4FAB), AMSAT Vice President for Engineering, said that the spaceframe arrived in good shape after being trucked across the country. He indicated that the next job is a thorough inspection of all the various pieces and then applying special coating to them.

Future ANS bulletins will provide updates on the progress of the Phase-3D integration as events warrant.

[The AMSAT News Serive (ANS) wishes to thank Dick Jansson and Stan Wood (WA4NFY) for this information.]

Former Apollo-11 Astronaut Talks To STS-65 Astronauts With SAREX

On Saturday July 16, the 25th anniversary of the liftoff of Apollo-11 on its historic journey to the moon, General Thomas Stafford (Ret), a former NASA astronaut who flew on-board several Gemini and Apollo missions, exchanged greetings with STS-65 mission commander Robert Cabana, KC5HBV, using the Shuttle Amateur Radio Experiment (SAREX) radio. General Stafford was in Oklahoma City attending the Airshow America. Using the SAREX telebridge, General Stafford was able to communicate with Commander Cabana first through a ground station in Hawaii and then through a ground station in San Diego. A special phone patch also allowed the crowd of 150,000 spectators at the airshow to hear this historic SAREX contact. After Commander Cabana extended his greeting from space, Stafford asked about the Shuttle and living in space. General Stafford was quick to point out that "the Space Shuttle can be considered luxurious living as compared to that small capsule I flew in during my flight on Apollo-10 25 years ago". General Stafford thanked Commander Cabana for the contact and signed clear.

One observation made by the SAREX team was the virtual silence of the audience during this live exchange between the former astronaut and the Space Shuttle Commander as compared to the deafening roar of the crowd and the planes during the air show. It seemed that the audiance was truly transfixed by our (amateur radio's) ability to talk to an astronaut while they are in space.

[The AMSAT News Service would like to thank the SAREX Working Group and Frank Bauer (KA3HDO) for this bulletin item. Others who deserve mention and assisted in this SAREX contact are listed below.]

Weekly OSCAR Status Reports: 23-JUL-94

AO-13: Current Transponder Operating Schedule:
M QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Jul 11 - Sep 12
Mode-B : MA 0 to MA 90 | Omnis : MA 230 to MA 30
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 122 |<- S beacon only
Mode-S : MA 122 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 | Move to attitude 230/0, Sep 12
[G3RUH/DB2OS/VK5AGR]

DO-17: DO-17 still continues to transmit its voice message on a downlink frequency of 145.825 MHz.

RS-10: N2WWD would like to pass on some observations regarding RS-10. The signal in the past week seems stronger than normal. More interesting than this is that it appears that the translation constant between the Mode-A passbands seems to have shifted by about 1 KHz. This translation constant appears to have moved from 5 KHz to 6 KHz (when the effects of Doppler shift are removed). Thus, in the past where 145.910/29.386 MHz would be a corres-onding uplink/downlink frequency pair, however, presently N2WWD needs to use 145.910/29.385 MHz to achieve the same results. This holds consistently for 3 different sets of Keplerian elements used. N2WWD would like to know if others have similar reports? [N2WWD]

AO-21: The speech synthesizer will be reproducing Neil Armstrongs famous words that he spoke as he stepped upon the Moon's surface 25 years ago this past week. Listen for the downlink on 145.987 MHz FM. [DB2OS]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ N0QCU. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

It was not a trick. It is a special message that plays twice in a row during
a pass. BTW, does anyone know the schedule for voice/pre-recorded voice/wefax
on AO-21? i.e., is there a certain minute that the repeater comes active?

myles KG5AI

1163. AO-27, UO-11, UO-15, AO-21 questions

Newsgroup: rec.radio.amateur.space
Date: 1994-07-25 08:46:00 UTC

AO-27:
I worked AO-27 for the first time tonight and noticed something. Is it usually full of ragchewers that tie up the satellite like they are on 75 meters? Sounded like it was their own personal satellite. Is it on all the time? Seemed like I had to key up a few times and then there was the signal all of a sudden. It was up to 23 degrees before I finally heard it.

UO-11, UO-15:
What are these birds used for and what modes do they use? Think I heard something digital on 145.825 when UO-11 came over but when UO-15 passed, I heard nothing on 435.120.

AO-21:
Are all transponders active on this? I only heard a beacon on 145.819 and, of course, the digital repeater.

Thanks es 73

Your observation of the type of operation on AO-27 is accurate. I used to work it from my mobile station, but have had to give it up due to the large number of high power base stations with large uplink beams using it for passing recipes etc. On the rare occasions when this satellite is not cluttered, 4 W talkies with rubber duckies can work each other.

AO-21 is much worse because it has been around longer. The regulars on this one use 40 el uplink beams and 1 KW plus amplifiers. The downlink is 145.987 Mhz FM and the uplink is 435.016 Mhz FM.

For info on the other birds you mightr pick up a copy of "The Satellite Experimenters Handbook".

1169. Two-Line Orbital Element Sets (TLE437)

Newsgroup: rec.radio.amateur.space
Date: 1994-07-26 01:17:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.775185420@afit.af.mil>
Source record: 27124

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

1170. Re: AO-27, UO-11, UO-15, AO-21 questions

Newsgroup: rec.radio.amateur.space
Date: 1994-07-26 05:25:18 UTC
From: mikec@comtch.iea.com
Message-ID: <3126nu$kcu@krel.iea.com>
Source record: 27123

: Your observation of the type of operation on AO-27 is accurate. I used to
: work it from my mobile station, but have had to give it up due to the
: large number of high power base stations with large uplink beams using it
: for passing recipes etc. On the rare occasions when this satellite is
: not cluttered, 4 W talkies with rubber duckies can work each other.

I don't work AO-27 much..

: AO-21 is much worse because it has been around longer. The regulars on
: this one use 40 el uplink beams and 1 KW plus amplifiers. The downlink
: is 145.987 Mhz FM and the uplink is 435.016 Mhz FM.

C'mon.. that's a bit of a stretch.. Most satellite stations, mine
included run 50-70 watts uplink into a regular satellite antenna
of about 9 elements. Get real, you _can_ work this bird with a
handheld, but when you have a nice satellite setup, the handheld
doesn't cut it.. Even I have trouble with AO-21 from time to
time, so the secret to working this bird is keep trying! I have
called CQ on 21 and nobody answered - just the right (wrong) time
of day and nobody was on but me, and that's what I call having your
own satellite :-)

: For info on the other birds you mightr pick up a copy of "The Satellite
: Experimenters Handbook".

Good idea!

>How long did it take to reach Earth from the Moon?

I have also heard that there were amateurs monitoring these comms as
well. I've often wondered what the time delay was as it is not
noticible in recordings of the missions shown on TV. Anyone have the
info?

Source record: 27129

I am a self-confessed Mac bigot but I must state that I have found no Mac satellite software tha handles the PacSat Broadcast Protocol. I ftp'ed the "Broadcast" program from ftp.demon.co.uk /pub/ham/mac but it is very old, and would crash with a System Error under System 7.1 on a Quadra 700.

The program that Gilbert Macklin did was receive-only and he is currently working on a up/download version, but is not nearly done. And these programs lack the scheduling features of WiSP or SatSked.

I was forced to put the Apple 486 card in my Quadra just to run Windows and WiSP.

I would be pleased to know of some working Broadcast Protocol and scheduling software for the Mac.

Actually, the time delay was noticeable as the Apollo spacecraft neared the moon. It takes about 1.3 seconds for the signal to reach Earth from the moon, so there are noticeable pauses (>2.6 seconds) in the communications.

Jeff, KC1MK

1175. Comet images from NSSDC

Newsgroup: rec.radio.amateur.space

NSSDC HANDLES RECORD-BREAKING DEMAND FOR JUPITER COMET IMPACT IMAGES

The National Space Science Data Center (NSSDC) at NASA's Goddard Space Flight Center is pleased to announces the availability of the latest Comet P/Shoemaker-Levy 9 (SL-9) impact images taken by the Hubble Space Telescope, Keck telescope, Calar Alto, European Southern, La Palma, MSSSO, etc.

NSSDC staff gathered close to 200 observations and associated results from around the world and made them available using the NSSDC World Wide Web (WWW) service.

The effort demonstrates, for the first time, the "real world" use of the World Wide Web infrastructure for the massive and almost real-time access to NASA data. It also demonstrates how rapidly information systems can be tailored to resource constraints and user demands.

We have been inundated with note of appreciation from a broad range of users. Thanks you all for the constant feedback and bug reports! I am humbled by knowing that you are so impressed with our service. It's been a very, very busy week and I want to use this chance to thanks you all allowing us to serve you. By the way, keep us on your hotlist for the Apollo 25 pages.

SUMMARY FOR ACCESS TO NSSDC SL-9 WWW SYSTEM

Covers : Mon Jul 18 12:00:00 AM -- Tue Jul 26 14:29:27 PM EDT 1994
Total Access : 339,907
Peak Hourly Access : 5,904 (Thu Jul 21 2:00 PM EDT 1994)
Peak Daily Access : 73,557 (Thu Jul 21 1994)

The SL-9 data and information system can be accessed using the World Wide Web (WWW). The URL is below.

http://www.gsfc.nasa.gov/planetary/COMET.HTML

1176. Internet Offers Space Station Petition

Newsgroup: rec.radio.amateur.space
Date: 1994-07-27 22:45:04 UTC
From: ssa@SEDS.LPL.Arizona.EDU
Message-ID: <316o1g$3k3@news.CCIT.Arizona.EDU>
Source record: 27130

Dear Colleague:

Student Space Action, a national organization of students dedicated to the preservation of space exploration, would like to inform you of a way in which you can directly voice your support for the space program. Initially, our focus will be on the space station, but we plan to branch out into areas such as manned and unmanned programs, SSRT technology and other areas of interest involving NASA and our national space effort as the organization strengthens. Just this past June, members of Student Space Action traveled to Washington, D.C. and helped in the successful lobbying of Congress in support of the space station. While we were successful this year, we can not sit back and wait for next year's vote, we must press ahead.

If you believe the space program is a vital part of our country's future, both in economic growth and technological advancement, then sign the Student Space Action's Interactive Petition. You can tell your elected officials exactly how much you support the space program by signing the petition. Simply follow these steps:

Telnet seds.lpl.arizona.edu
login> space

After you submit the petition, you will receive information on your Representatives so you can contact them further by phone or mail if you desire.

The petition is also accessible through the World Wide Web. Simply go to the following URL and follow the directions:

URL: http://seds.lpl.arizona.edu/ssa/petition.html

Answer the questions and submit the petition and you will receive the same information as the telnet version. You will also have the option of linking to the space station home page where you can read up-to-date information on the space station, including issues of "Space Station This Week."

If you believe that NASA should remain as an engine for continued space exploration, then tell everyone you know to sign this petition.

Please forward this message to anyone you may feel would want to be a part of this effort.

SPACE STATION: IT'S ABOUT LIFE ON EARTH!!

If you believe that our government, by supporting an initiative like
the space station, is making an investment in the future generation
of this great nation, then send your message to Washington by
signing the Student Space Action Interactive Petition.

Your voice does count! And it WILL make a difference!

Sincerely,

--
Student Space Action
"Don't Take Away Our Frontier!"

In article <30uuo8$reb@aggedor.rmit.EDU.AU>, david@pitvax.xx.rmit.edu.au writes:
> I heard an unusual message transmitted by AO-21 on a short, low elevation
> pass this weekend, on the 70cm - 2m FM translator output.
>
> It was unmistakable - Neil Armstrongs immortal words "One small step for
> (a) man, one giant leap for mankind."
>
> Then the satellite went below the horizon and the signal faded into the
> noise.
>
> Was this to mark the 25th anniversary of the moon landing or was someone
> in VK playing tricks?
>

Apparently, not enough people read SpaceNews :-)

* AMSAT-OSCAR-21 NEWS *
==========
At 16:17:43 EDT (20:17:43 UTC), Sunday afternoon, July 20, 1969, astronaut
Neil A. Armstrong spoke the words:

"Houston, Tranquility Base here. The Eagle has landed."

At 20:56 EDT, later the same day, Armstrong stepped down from the ladder
of the Lunar Module onto the Moon's surface and said:

"That's one small step for (a) man, one giant leap for mankind."

Edwin Aldrin followed him about 15 Minutes later, while Michael Collins
orbited the Moon with the APOLLO-11 Command and Service Module at an
altitude of 100 kilometers.

To commemorate the anniversary of this historic event, a special Multi-Media
Broadcast has been uploaded into the RUDAK system on the AMSAT-OSCAR-21
satellite that includes the historic words and the APOLLO-11 logo in APT
FAX format.

AMSAT-OSCAR-21's RUDAK downlink is a frequency of 145.987 MHz and can be
received anywhere in the world using a narrowband FM receiver when the
satellite is above the local horizon.

[Info via Peter, DB2OS, on behalf of AMSAT-DL and AMSAT-Russia]

=========

MONDAY AUGUST 1, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* AUGUST SPACE CALENDAR *
========================
Aug ?? - FAST (Fast Auroral Snapshot) Pegasus Launch
Aug ?? - ETS-VI (Engineering Test Satellite) H2 Launch (Japan)
Aug 05 - 25th Anniversary (1969), Mariner 7, Mars Flyby
Aug 06 - Comet Machholz Returns
Aug 12 - Perseids Meteor Shower (Potential Meteor Storm)
Aug 18 - STS-68, Endeavour, Shuttle Radar Laboratory (SRL-2)
Aug 25 - 5th Anniversary (1989), Voyager 2, Neptune Flyby
Aug 28 - 205th Anniversary (1789), William Herschel's Discovery of Enceladus (Saturn Moon)
Aug 31 - DSPSE (Clementine), Asteroid 1620 Geographus Flyby

[Info via Ron Baalke]

* VE3ONT EME CONTEST SKED *
===========================
The Toronto VHF Society, VE3ONT, will participate in this year's ARRL EME Contest using the Institute for Space and Terrestrial Science's 46m (150') Algonquin Park dish (located at grid square FN05xw). This year's operation will provide an increased opportunity to work 144 MHz stations.

UTC Date VE3ONT TX Freq Listening Range Approx. Times

29-Oct-94 432.050 MHz 432.050 - 432.060 MHz 0645 - 1815 UTC
30-Oct-94 1296.050 MHz 1296.050 - 1296.060 MHz 0754 - 1844 UTC
26-Nov-94 144.100 MHz 144.100 - 144.110 MHz 0538 - 1645 UTC
27-Nov-94 144.100 MHz 144.100 - 144.110 MHz 0646 - 1713 UTC

Because the Algonquin dish has a 9 degree lower elevation limit, stations with horizon fixed antennas in eastern North America will have a limited chance to work VE3ONT. The following operating hints will improve your

chance of making a QSO:

- As in 1993, VE3ONT will work "split" frequency. Do not call on VE3ONT's TX frequency. Pick a random frequency in the listening range. Use the full range. VE3ONT will be looking for stations in the clear.

- VE3ONT will use circular polarization on all bands. You may use linear or circular polarization to make a contact with VE3ONT. If circular, use RHCP on TX and RX for the 144 and 432 MHz bands. On 1296 MHz, they will have switchable sense so you may use either the satellite or EME polarization convention.

- Conditions permitting, VE3ONT may start each operating period on SSB to work strong stations as quickly as possible. Please do not call again for a second contact on CW. Conversely, if you make a contact on CW, please do not call again for a SSB QSO.

- All contacts will be "random" with no schedules or sequencing. Please be patient. VE3ONT experienced a great deal of QRM during last year's event.

Low power and OSCAR class stations are encouraged to make an EME contact with VE3ONT. 100 watts delivered to a single long yagi should be sufficient on the 144 and 432 MHz bands. On 1296 MHz, stations were worked with as little as 10 watts and a 2m (6') dish in 1993.

Be advised that use of the dish at the Algonquin Space Complex is always subject to last minute preemption for non-Amateur purposes.

QSLs with an SAE should be directed to Dennis Mungham VE3ASO, RR 3, Mountain, Ontario, Canada, K0E1S0. Reception reports are also welcome. Send your log to the ARRL.

For further information, contact Peter Shilton VE3VD, (905) 774-8766. The latest developments will be provided at the Central States VHF Conference July 29-30, Memphis, TN, and the International EME Conference, Gottskars, Sweden, August 26-28.

* NEW SPACE ORGANIZATION *
==========
A group of space science educators involved in the use of classroom and school space simulators (including permanent, semi-permanent, and temporary simulators) met at University School in Shaker Heights, Ohio (a suburb of Cleveland) during July of 1994 for the purpose of establishing a national organization.

The purposes of the organization are:

1. To facilitate the exchange of ideas, information, and technical enhancements among simulator using educators.

2. To assist teachers interested in developing space simulators.

3. To provide consultation services to teachers and schools
regarding the use of space simulators in space science education.

4. To encourage the use of the information superhighway as a tool
for enhancing space science simulations.

5. To provide assistance regarding sources of free or low cost
resources and materials from the aerospace community, government
organizations, and information providers.

6. To advance the use of simulation as an educational technique in
all areas of education.

Membership in The National Association of Space Simulating
Educators is open to anyone interested in education. The
organization's focus is school educators at all levels from pre-K
through college.

For a free informational pamphlet, write The National Association
of Space Simulating Educators, attn. Robert E. Morgan, University
School, 20701 Brantley Rd., Shaker Heights, Ohio 44122 or send
electronic mail requesting the pamphlet to: nasse@shadowso.com.

1184. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1994-07-30 03:33:24 UTC
From: tkelso@afit.af.mil
Message-ID: <rec-radio-info_775673581@unomaha.edu>
Source record: 27137
Cross-posted to: rec.radio.amateur.space,rec.radio.info

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.info on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (also updated daily) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a eleven-character name.

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

< Dated information here >

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat

transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

--

AMSAT-UK Land-Line Phone Numer Changes For Non-UK Callers

Some of you will be aware that as from 1995 April 16, all UK telephone area codes will change. With five exceptions listed below, all will simply acquire a leading digit "1".

Thus for example, when calling Amsat-UK from overseas, after 95-APR-16, you will ring +44 181 989 6741.
^
+---- Additional "1"

Key: "+" is your code for International access, "44" is UK, and "181" is the new code. (The present code is "81").

>From 94-AUG-01 until 95-APR-16 both new and old codes will work to allow these changes to be phased in.

They are designed to ensure that Britain has enough dialling codes to last well into the next century.

Remember, the old area codes will cease to work after 95-APR-16; the new ones are already activated.

So start changing your memory phones and databases now!

And of course, beware the overlap problem that will plague us for a couple of years while old numbers persist in written material, and the new numbers appear early. You should be able to tell the difference, as NONE of the present day "old" UK codes commences with a one.

The five exceptions mentioned, which will have completely new area codes, are:

City Old Code New Code

Leeds 532 1132
Sheffield 742 1142
Nottingham 602 1159
Leicester 533 1162

Bristol 272 1179

[The AMSAT News Serive (ANS) wishes to thank James Miller (G3RUH) for this bulletin item.]

[G3RUH/DB2OS/VK5AGR]

DO-17: DO-17 still continues to transmit its voice message on a downlink frequency of 145.825 MHz.

RS-10: WC9C reports that RS-10 has been performing well. Although the CW Robot was off for about a week, it is now back on. Since WC9C got back on around Field Day after being off for a few months he has noticed a change in the satellite's 10 meter antenna pattern. Now it is about 6-10 dB weaker as it approaches and is stronger as it passes by. This was just the opposite just a few months ago. Does anyone know if the "parent" spacecraft orientation has changed? Last week the Special Event Station WA3NAN was on 29.391 MHz and heard lots of station trying to working them. [WC9C]

AO-10: KC6EIJ reports that AO-10 is putting down excellent signals but now suffers from NO OPERATORS! He suggests that before you start you satellite operations each day, take a "listen" to AO-10 and find out how it is doing. DON'T WRITE OFF AO-10 YET BECAUSE IT STILL HAS A LOT OF LIFE LEFT! [KC6EIJ]

UO-22: Operating normally. [K6OYY],

KO-23: Operating normally. [K6OYY]

KO-25: Operating normally with lots of activity. Numerous stations have noted the element sets for KO-25 are not accurate, but are usable. A similar problem happened on a previous OSCAR satellite launch, in that case the launch vehicle, or parts thereof were being tracked, instead of the satellite of interest. [K6OYY]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ N0QCU. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

1187. Two-Line Orbital Element Sets (TLE440)

Newsgroup: rec.radio.amateur.space
Date: 1994-07-31 14:27:19 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.775664839@afit.af.mil>
Source record: 27140

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Does anyone know the current status of UNAMSAT-1, carrying a meteor sounder ?

Has it already be launched ?

Thanks,

Chris Steyaert

A really good FAQ can be downloaded by E-mail from the ARRL Server.
Send the following:

To: Info@ARRL.org
Subject: (nl)
Message: send faqsat.txt
quit

While you're at it, also ask for the Help and Index files. Just put
"quit" as the last command.

Hope this helps.

There's an excellent booklet "How to use the amateur radio
Satellites" - Third Edition. by Keith C. Baker KB1SF.

I believe it goes for about $10 or so. You can order it
directly from Amsat 850 Sligo Ave. Silver Spring MD 20910.

I made it in the STS-65 packet "heard" list. I never saw my QSO# come
across my screen, but the Shuttle ovbiously tried to reply to my
connect request. Is this enough to qualify for a QSL card?

Hello ALL I wonder if anyone else has notice the change in RS-10 10 meter downlink? After reviewing my notes from observations taken about a year ago, The downlink seems to have switched. Now the signal is slightly weaker as it approaches, It was just the opposite before. All my oberservation where based on monitoring the Main CW Beacon. Anyone else Notice this? and Does anyone have a more detailed observations of the 10 meter downlink ? In the past the Russians used a full Dipole for the 10 mtr is it possible that this time its just a Monopole ? I cant seem to fine much if any information about there Cosmos Satellite which is the parent spacecraft for RS-10. Looking forward to any replys.. 73 GL de AL WC9C

1197. Oscar 10 questions

Newsgroup: rec.radio.amateur.space
Date: 1994-08-02 20:51:01 UTC
From: Wayne_Estes@csg.mot.com
Message-ID: <9408021550.ZM27670@SALCIUS2>
Source record: 27149

Question #1:

The Satellite Experimenter's Handbook says not to use Oscar 10 if the beason doesn't transmit a pure tone. On Sunday night the beacon sounded very distorted. As an experiment I tried sending a CQ in the passband and could hear myself on the downlink loud and clear. (nobody else was on the satellite)

Question #1:
Is it really true that I should avoid transmitting to Oscar 10 when the beacon does not transmit a pure tone?

Instant Track indicates that the Oscar 10 antennas are almost always severely off-pointed from earth (more than 90 degrees most of the time)

Question #2:
Are the Oscar 10 antennas omnidirectional enough to allow reliable contacts when the offpointing angle is large?

Source record: 27156

I broke down and bought a hand held GPS unit (GARMIN GPS-45)
and am interested is setting it up for land mobile in the
car.

The manufacturer sells an external, temp mount antenna for
more than a few dollars, so I plan to try to throw something
together.

The questions: What freq range(s) do the GPS transmiters use?
and, is there anything "special" in the antennas made for
use with this units? (circular pol?)

Thanks for any help.

Is anyone aware of any GPS base stations in the Scranton PA area? We have some survey work and are contemplating using a GPS receiver (need differential for better accuracy) to support the effort. We would like to know if there is a base station near, accuracy, cost of access, etc. Or is there another alternative that would give 1-2m accuracy in real-time? Any help would be appreciated.

For the past several weeks the keps for KO25 have not been producing accurate AOS, TCA, and LOS times. It is my belief that a more accurate set of keps for KO25 is the object NASA lists as Catalog Number 22828. W5IU, K5EKH, KG5OA, and myself have confirmed this by monitoring numerous Cat No. 22828 passes. Below is the current keps for the object with Cat. # 22828. Try these out in your tracking program and see if they do a better job for KO25. Please leave a message on KO23 or KO25 to let me know how this set works.
73 Ray, WA5QGD

1208. DSP Radio Shack

Newsgroup: rec.radio.amateur.space
Date: 1994-08-05 12:34:05 UTC
From: ken@fstop.csc.ti.com
Message-ID: <940805123405@ken_durham.sc.ti.com>
Source record: 27070

Radio Shack has a DSP box called DSP40 that is intended for SSB and CW noise and hetrodyne reduction. It has a 5W amp and speaker built in, a 3 position switch for bandwidth, and another for mode. The price is $79.95 and they had one in stock at the store I tried. I bought one and will try it out on AO-10 and AO-13 this weekend. WATCH HERE FOR THE PRAISE OR SCORN MESSAGE MONDAY.

KEN K5MBV

1209. Request for info.

SpaceNews
=========

MONDAY AUGUST 8, 1994

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is
published every week and is made available for unlimited distribution.

* DOVE NEWS *
=============
Jim White reports that DOVE is running a new set of software that tests the
digital to analog converter and other hardware and software capabilities of
the satellite. DOVE now transmits digitally generated tones through the DAC
and exercises software that implements two way communications between
on-board processors.

[Info via WD0E]

* REVISED AO-13 SCHEDULE *
==========================
A revised AO-13 transponder mode schedule for 1994 Sep 12 - Dec 19 is
presented below.

During the severe eclipses at the end of October, the mode-B transponder
will be ON from MA 0 to MA 30.

An expedition to The Gambia (C56) coincides with this period, and this
change is in response to its specific request.

N QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Sep 12 - Dec 19
Mode-B : MA 30 to MA 150 |<- OFF Oct 22 - Nov 07 for eclipses
Mode-B : MA 150 to MA 190 | max duration 2h 12m
Mode-BS : MA 190 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-B : MA 230 to MA 30 | Alon/Alat 230/0
Omnis : MA 250 to MA 140 | Move to attitude 180/0, Dec 19

The battery charge state is of paramount importance during eclipse seasons.
As always the command team may have to have to make temporary changes to the
published schedule. In that case we will try to minimise the inconvenience,

setting Mode-B OFF from MA 230-256 in the first instance.

Please don't rely on gossip and rumour! Continuous up to date information about AO-13 operations is always available on the beacons, 145.812 MHz or 2400.664 MHz in CW at 0 & 30 minutes past the hour, RTTY at 15 & 45 minutes past the hour and 400 bps PSK otherwise. These bulletins are also posted to Internet, ANS, Packet, PacSats etc, and many international newsletters. A 400 bps PSK decoder is available from G3RUH and several DSP products; display software P3C.EXE etc from many Amsat groups.

The active command stations are listed below, and constructive feedback about operations is always welcome.

Peter DB2OS @ DB0FAU.#NDS.DEU.EU
James G3RUH @ GB7DDX.#22.GBR.EU
Graham VK5AGR @ VK5WI.#ADL.#SA.AUS.OC

The above may also be reached via Internet (callsign@amsat.org) and KO-23. Please remember to state clearly a return address.

Notes prepared on behalf of, and in total cooperation with the above by:

James Miller G3RUH @ GB7DDX.#22.GBR.EU 1994 Aug 01 [Mon] 2014 utc

* WEBERSAT NEWS *
==========
WEBERSAT (WO-18) is broadcasting new pictures and light spectrometer data weekly. Software for the extraction, decoding, and display of spectrometer data, written by Bob (KB7KCL), is available by request on AO-16/LO-19, or directly from Weber State University. Monday utc, continues to be the day for the broadcast of the most recent spectrum, along with the week's WOD.

WeberWare 1.0, 1.2, 1.3, or a similar program is required for picture extraction, decoding, and display. WeberWare 1.3 is the current software version, and is available from Weber State University, AMSAT-NA, or AMSAT-UK. The most recent WeberSat double field image is number 9/13.

WO-18 is currently sending another portion of the base line survey of all telemetry channels. The selected channels are 0x36 54 +Y Temp, 0x37 55 PSKHPA Temp, 0x38 56 +Z Temp, 0x39 57 Horizon Sensor 1, 0x3A 58 Spectrometer Light Sensor, and 0x3B 59 Impact Sensor. This is an excellent opportunity for a student, group, or class to use this data to better understand WeberSat's experiments. WOD collection and broadcast will adhere to the following schedule:

28 July/Week2: **Variable (Requests for specific channels will be taken.)
04 August/Week3: BCR, 21 22 29 2F 33 36
11 August/Week4: Temperatures and impact detector, Ch# 14 2F 30 35 3B 40
18 August/Week1: Array currents, Ch# 26 27 28 29 2A 2B
25 August/Week2: **Variable (Requests for specific channels will be taken.)

**If no requests are received for specific WOD, then another part of the base line survey of all telemetry channels will be conducted.

The Russian RS-10/11 and RS-12/13 satellites use 10 meter
transceivers. A good description is in the "How to Use
the Amateur Radio Satellites" booklet which I mentioned in
a previous post.

> Any help would be appreciated.

Either you have been misinformed, or I am missing something big. I pretty well know that GPS signals aren't transmitted by any "base stations" on land. They come from 12 or so satellites that are circling the earth on low polar orbits. The receiver works by receiving the signals from any three of these satellites at a given moment (which is guaranteed on any point on the earth, due to the orbital configuration of the satellites). Therefore, you don't have to worry about access to GPS signals no matter where you are; New York City or Tibet doesn't make any difference.

Unless you're talking about some other GPS ("General Pinpointing Service"? :)) or a special land-based factor about GPS signals that I wasn't aware of (like what you mean by "differential"), I am pretty sure that what I have explained here is accurate.

Source record: 27064

Excerpts from netnews.rec.radio.amateur.space: 4-Aug-94 GPS Freq and antenna questions by Gary Delong@ctron.com
> The questions: What freq range(s) do the GPS transmiters use?
> and, is there anything "special" in the antennas made for
> use with this units? (circular pol?)

Here is the only GPS frequency information that I have on hand. This is from a public domain frequency list named Scanner Searchers Guide by N5OWK dated January 1990, which I downloaded from this newsgroup or a similar one:

1575.42 MHz is the Navstar Global Positioning System (GPS) frequency L1, and 1227.6 MHz is L2.

That's all it says. I hope this helps a little. But I won't be able to help you about the antenna at all, I'm afraid.

When the beacon on AO-10 starts FM'ing it usually indicates that the system voltage is getting lower. In order to conserve the batteries it is a good idea not to use the transponder. The fact that most people observe this and that AO-10 is usually pretty quiet (few users) has contributed to its continued operation. How it will survive between the crash of AO-13 and the launch of the new P3D satellite remains to be seen. I imagine it will see a lot of use as the only high orbit bird available during this time.

Since the computer on AO-10 succumbed to radiation a few years ago, there is no way for ground controllers to change the spacecraft's orientation. As the orientation slowly drifts the pointing angle as well as the percentage of sun striking the solar panels also changes. This is why the strength of the downlink

varies considerably month to month depending on the antenna
direction and the amount of power available to charge the batteries.
It is possible, based on the last known attitude of AO-10 to
calculate the current and future attitudes. Currently the
ALON/ALAT are approx. 218/-15 with an illumination of 87% (info
courtesy G3RUH). The illumination will decline over the next
two months, down to 11% in October. By January it will be back
up to almost 100% and will continue on this 6 month cycle.
The ALON is slowly decreasing (201 in Jan) and the ALAT is slowly
increasing (-19 in Jan).

Perhaps NASA will donate a shuttle mission to replace the computer
with a newer radiation-hardened unit? <g>

1217. STS-65 Commemorative TLI Burn

Newsgroup: rec.radio.amateur.space
Date: 1994-08-06 02:49:06 UTC
From: tstader@aol.com
Message-ID: <31utn2$o5d@search01.news.aol.com>
Source record: 27073

I am re-posting this note from a message I got on AOL. Please reply directly to Dan Adamo at his AOL account: Adamod@aol.com

Text follows:
==========
Date: Thu, Aug 4, 1994 7:43 PM EDT
From: Adamod
Subj: STS-65 Commemorative TLI Burn

File: TLI.sit (58540 bytes)

MacSPOC Users-

During STS-65, you'll recall MacMission Control supported targeting of a commemorative TransLunar Injection (TLI) burn. Time of IGnition (TIG) for this burn was 25 years to the minute after a similar TLI was performed by Apollo-11 to break free of low earth orbit. The commemorative TLI was tageted to reach a point 100 miles above the moon's farside 25 years to the minute after Apollo-11's Lunar Orbit Insertion (LOI) burn TIG.

With targets from MacMission Control, Flight Dynamics Officers (FDOs) in the real Mission Control filled out a Pre-Advisory Data (PAD) for the commemorative TLI burn. This PAD, together with plots of STS-65's post-TLI trajectory relative to the earth and moon, are enclosed as 3 TeachText documents for your viewing pleasure.

An image of the commemorative TLI PAD was uplinked as a FAX to the STS-65 crew around 8:30 AM CDT July 16, 25 years after Apollo-11 was launched. Upon receiving the PAD, STS-65 Commander Bob Cabana remarked, "Don't we wish!" Powered Explicit Guidance mode 7 (PEG 7) targets computed by MacMission Control appear on the PAD as an in-track speed increase of 9586.3 fps, a northward cross-track velocity change of 3073.7 fps, and a radial upward velocity change of 5944.0 fps. Using both Orbital Maneuvering System (OMS) engines for a total thrust of 12000 lbs, Columbia would have required a TLI burn duration (TGO) of 2 hrs 03 min 24 sec to build up these velocity changes. Actual OMS fuel available to Columbia at TLI TIG would have supported less than 5 min of 2-engine burn time, and most of this was allocated to STS-65 deorbit.

It's worth noting Apollo-11 weighed nearly 200000 lbs at TLI TIG, only about 45000 lbs less than Columbia's WT on the commemorative PAD. Unlike Columbia, however, about 75% of Apollo-11's weight was propellant to feed the Saturn IV-B's single J-2 engine during TLI. Because the J-2 developed about 200000 lbs of thrust, Apollo-11's TLI required less than 6 min to perform.

The 2 post-TLI plots are in the ecliptic plane. This is coincident with earth's orbit around the sun. The moon's orbit about earth is less than 5 deg from the ecliptic. The Vernal Equinox indicated on these plots is the Sun's apparent position as viewed from earth when Spring begins in March. The Sun's position in mid-July is also indicated on the plots.

Does anyone have a guess as to when the next (manned) TLI burn will be performed for real?

-Dan Adamo

1218. MacSPOC updates

Newsgroup: rec.radio.amateur.space
Date: 1994-08-06 02:54:06 UTC
From: tstader@aol.com
Message-ID: <31uu0e$o95@search01.news.aol.com>
Source record: 27065

If there is enough of a desire to have them posted... I will post Dan Adamo's MacSPOC updates for the Shuttle missions as soon as they become available.

Here is the skinny of the Mac program from the AOL files description:

*** MacSPOC Info ***

Welcome to an enhanced awareness of satellites in earth orbit! MacSPOC (SPOC = Spacecraft Personal Orbit Computations) v1.5 is a commercial real time satellite trajectory display. Previous MacSPOC versions were evaluated by orbiting astronauts during the STS-41, STS-43, and STS-52 missions. MacSPOC continues to be used in control centers and schools across the country. The MacSPOCl v1.5 configuration regularly supports Mission Control planning for the Shuttle Amateur Radio Experiment (SAREX) program. A v1.1 package is available for downloading from AOL. It's similar to the MacSPOC version flown aboard STS-41 and is copyrighted freeware for you to "test drive".

By downloading your MacSPOC test drive, you agree to two restrictions. First, you may not disassemble or modify MacSPOC code. Second, although you may produce unlimited copies of your download, it may not be distributed to others for any fee or compensation.

Real world MacSPOC trajectory updates, called checkpoints, are uploaded during Space Shuttle missions and upon request. Because they're only about 500 bytes in size, checkpoints are easy to send and receive. To obtain free checkpoints, send your e-mail address via AOL to "AdamoD". If you'd also like to receive a free MacSPOC v1.5 brochure, include your name and mailing address too.

Two functionally identical MacSPOC v1.1 download packages are available to support various Macintosh models. Choose the "MacSPOCfpu.sit" package only if your Macintosh has a 6888x FPU (math co-processor) chip. Other models, including 68040-equipped machines running with cache memory OFF, can utilize the "MacSPOC+.sit" package. Both packages are compatible with either System 6 or System 7.

Your MacSPOC v1.1 download consists of four parts: the MacSPOC application, a world map bitmap file "SPOCMap", a database of STS-52 earth observation sites "Earth Obs", and a checkpoint formatting utility called "Convert2v1.1". To install MacSPOC v1.1 after your download is unstuffed, be sure at least the first three of these files reside in the same folder.

A quick hypothetical demo of MacSPOC displays can be obtained with the following steps. First, if a file named "MacSPOC.cp" exists in the folder occupied by MacSPOC, delete it, rename it, or drag it elsewhere. Next,

open (double-click) the MacSPOC application and await appearance of a dialog box with "Edit Liftoff GMT" as its heading. Click the "Check SV..." button, then click the "Save" button. A new dialog will appear, asking "Ready to Propagate State Vector?". Click the "Go!" button in this dialog, and you'll be off and running.

At some point prior to tracking a real satellite like a Space Shuttle, you should be sure your Macintosh system clock is set accurately via the Control Panel. Next, select "Time Zone..." from MacSPOC's "Update" menu. Click the radio button which pertains to the time zone your system clock is keeping, then click the "Save" button. Unless you lose your copy of MacSPOC, you'll need to repeat this procedure only when you change time zones in your system clock, as when you "fall back" to standard time the last Sunday in October.

All MacSPOC checkpoints are uploaded in v1.5 format. After downloading, you can translate a checkpoint to v1.1 format by using the Convert2v1.1 utility. Just load Convert2v1.1, then use it to open the downloaded v1.5 checkpoint. The checkpoint created by Convert2v1.1 can then be double-clicked or opened for processing by MacSPOC v1.1. The only information lost during this conversion process defines maneuvers which might be included to change the orbit originally defined in the checkpoint.
-Dan Adamo,
MacSPOC Developer

>Either you have been misinformed, or I am missing something big. I
>pretty well know that GPS signals aren't transmitted by any "base
>stations" on land. They come from 12 or so satellites that are circling
>the earth on low polar orbits. The receiver works by receiving the
>signals from any three of these satellites at a given moment (which is
>guaranteed on any point on the earth, due to the orbital configuration
>of the satellites). Therefore, you don't have to worry about access to
>GPS signals no matter where you are; New York City or Tibet doesn't make
>any difference.
>
>Unless you're talking about some other GPS ("General Pinpointing
>Service"? :)) or a special land-based factor about GPS signals that I
>wasn't aware of (like what you mean by "differential"), I am pretty sure
>that what I have explained here is accurate.

You're missing something pretty big. Differential GPS is the system
whereby a GPS receiver at a known geographical benchmark continously
broadcasts it's position via radio. Receivers in the field then
combine the offset from known position reported by the benchmark
receiver with their current satellite reported position to defeat
the SA scatter deliberately introduced into the GPS satellite
system by the military. Most GPS receiver manufacturers, like Garmin
and Trimble, support differential GPS operation in their newer units.

Benchmark transmissions are becoming more common. Some (sponsored
by the FAA) are on commercial FM broadcast subcarriers, and others
are on land mobile, marine, or amateur frequencies. The FAA and the
Coast Guard are cooperating in setting up this system of benchmark
receivers so that precision aircraft and boat navigation under zero-zero
visibility conditions can be done. Some amateurs are also setting
up benchmark systems for amateur navigation experiments. Instead
of the typical civilian GPS navigational position uncertainty of
100 meters, differential GPS can offer position information accurate

to a few centimeters. This is vital for zero-zero capability since few runways are over 100 meters wide. It's also vital in some shipping channels, for precision mapping, and for positioning of equipment such as offshore drill rigs. And it's obviously necessary for land vehicle navigation since most roadways are only 18 feet wide and lanes are only 9 feet wide. Errors of 100 meters are unacceptable.

Gary

SB KEPS @ AMSAT $ORBS-217.D
Orbital Elements 217.MICROS

HR AMSAT ORBITAL ELEMENTS FOR THE MICROSATS
FROM WA5QGD FORT WORTH,TX August 5, 1994
BID: $ORBS-217.D
TO ALL RADIO AMATEURS BT

For the past several weeks the keps for KO25 have not been producing
accurate AOS, TCA, and LOS times. It is my belief that a more
accurate set of keps for KO25 is the object NASA lists as Catalog
Number 22828. W5IU, K5EKH, KG5OA, and myself have confirmed this by
monitoring numerous Cat No. 22828 passes. Below is the current keps
for the object with Cat. # 22828. Try these out in your tracking
program and see if they do a better job for KO25. Please leave a
message on KO23 or KO25 to let me know how this set works.
73 Ray, WA5QGD

For the past several weeks the keps for KO25 have not been producing
accurate AOS, TCA, and LOS times. It is my belief that a more
accurate set of keps for KO25 is the object NASA lists as Catalog
Number 22828. W5IU, K5EKH, KG5OA, and myself have confirmed this by
monitoring numerous Cat No. 22828 passes. Below is the current keps
for the object with Cat. # 22828. Try these out in your tracking
program and see if they do a better job for KO25. Please leave a
message on KO23 or KO25 to let me know how this set works.
73 Ray, WA5QGD

1226. Student Space Action Announces Home Page

Newsgroup: rec.radio.amateur.space
Date: 1994-08-06 16:44:00 UTC
From: ssa@SEDS.LPL.Arizona.EDU
Message-ID: <320ekg$rr6@news.CCIT.Arizona.EDU>
Source record: 27071

STUDENT SPACE ACTION ANNOUNCES HOME PAGE!!
Student Space Action would like to announce the availability of their home page. First of all, Student Space Action is a growing national organization of students who's mission it is to educate people on the values and benefits space exploration has on our everyday lives and deliver a message to Congress on a regular basis that illustrates the strong student support for space exploration.

SSA's home page is where you can learn about the organization's projects, including their Online Space Station Petition, as well as other projects at universities around the country. Simply point your World Wide Web browser at the following URL:

http://seds.lpl.arizona.edu/~ssa/ssahomepage.html

Thank you for your support.

1227. re: MacSPOC

Newsgroup: rec.radio.amateur.space
Date: 1994-08-06 19:38:37 UTC
From: pchien@ids.net
Message-ID: <321obg$m9r@paperboy.ids.net>
Source record: 27076

MacSPOC is an incredible program. I've used many versions up
through version 1.5 and it's got features unavailable
in any other satellite tracking program I've seen. You can
input in an entire set of shuttle maneuvers, attitudes and burns
and macSpoc will tell you where the shuttle will end up - and
where it will be pointing! The program gives you a view out
the window showing you where each window is pointed on the Earth's
surface, and a simulated view which corresponds to the actual
fieled of view out of the astronaut's window. On extremely useful
feature for SAREX enthusiasts is the determinating of the point on
the Earth's surface where the shuttle's SAREX antenna is pointing.
For photography buffs the database include recommended shutter
settings for different earth obs targets.

The primary input for keplerian elements is in the M50 format, but
Dan has also added the capability to accept two line elements from
the standard Amsat format. One of the key features it is missing
though is the capability to select a satellite from a text file of
keps.

The key limitation to MacSPOC is that it's so specifically designed
for use by an astronaut in space (or a payload officer of flight
dynamic officer on the ground) that it's fairly difficult to use -
unless you're heavily into the shuttle program.

In any case it's extremely impressive, and the shareware version
is certainly worth looking at, even though it's an earlier version.

How often can you say that you've tried software which has actually
been used aboard the shuttle?

Philip Chien KC4YER
no sig yet - and yes I'm just a satisifed user without any financial
interest in MacSPOC or Dan Adamo.

1228. Re: GPS base stations in Scranton PA area?

I could have been missing something, but I suspect he was looking for access
to a differential reference station, like some of the new commercial systems
cropping up in FM subcarriers.

Oh, yes... US Army Corps of Engineers, and the Coast Guard have started
putting up LF/MF (~300 khz) differential systems along the coast.

1230. STS-65 Commemorative TLI Burn

Newsgroup: rec.radio.amateur.space
Date: 1994-08-07 14:09:07 UTC
From: tstader@aol.com
Message-ID: <322pu3$b9m@search01.news.aol.com>
Source record: 27081

reposted from AOL:
==========
Date: Thu, Aug 4, 1994 7:43 PM EDT
From: Adamod
Subj: STS-65 Commemorative TLI Burn
File: TLI.sit (58540 bytes)

MacSPOC Users-

During STS-65, you'll recall MacMission Control supported targeting of a commemorative TransLunar Injection (TLI) burn. Time of IGnition (TIG) for this burn was 25 years to the minute after a similar TLI was performed by Apollo-11 to break free of low earth orbit. The commemorative TLI was tageted to reach a point 100 miles above the moon's farside 25 years to the minute after Apollo-11's Lunar Orbit Insertion (LOI) burn TIG.

With targets from MacMission Control, Flight Dynamics Officers (FDOs) in the real Mission Control filled out a Pre-Advisory Data (PAD) for the commemorative TLI burn. This PAD, together with plots of STS-65's post-TLI trajectory relative to the earth and moon, are enclosed as 3 TeachText documents for your viewing pleasure.

An image of the commemorative TLI PAD was uplinked as a FAX to the STS-65 crew around 8:30 AM CDT July 16, 25 years after Apollo-11 was launched. Upon receiving the PAD, STS-65 Commander Bob Cabana remarked, "Don't we wish!" Powered Explicit Guidance mode 7 (PEG 7) targets computed by MacMission Control appear on the PAD as an in-track speed increase of 9586.3 fps, a northward cross-track velocity change of 3073.7 fps, and a radial upward velocity change of 5944.0 fps. Using both Orbital Maneuvering System (OMS) engines for a total thrust of 12000 lbs, Columbia would have required a TLI burn duration (TGO) of 2 hrs 03 min 24 sec to build up these velocity changes. Actual OMS fuel available to Columbia at TLI TIG would have supported less than 5 min of 2-engine burn time, and most of this was allocated to STS-65 deorbit.

It's worth noting Apollo-11 weighed nearly 200000 lbs at TLI TIG, only about 45000 lbs less than Columbia's WT on the commemorative PAD. Unlike Columbia, however, about 75% of Apollo-11's weight was propellant to feed the Saturn IV-B's single J-2 engine during TLI. Because the J-2 developed about 200000 lbs of thrust, Apollo-11's TLI required less than 6 min to perform.

The 2 post-TLI plots are in the ecliptic plane. This is coincident with earth's orbit around the sun. The moon's orbit about earth is less than 5 deg from the ecliptic. The Vernal Equinox indicated on these plots is the Sun's apparent position as viewed from earth when Spring begins in March.

The Sun's position in mid-July is also indicated on the plots.

Does anyone have a guess as to when the next (manned) TLI burn will be performed for real?

-Dan Adamo

1231. Question on AO-21

Newsgroup: rec.radio.amateur.space
Date: 1994-08-08 01:34:35 UTC
From: etuggle@auc.trw.com
Message-ID: <1994Aug8.013435.21380@auc.trw.com>
Source record: 27085

I'm kinda new to amateur radio and OSCAR. I am interested in using AO-21. I've been doing some reading about the LEO sats, and most of the information I've read indicate one should be able to work them with a vertical. I have however, been having a few problems. So, I thought I'd post a question or two.

Is it realistic to expect to work AO-21 with the following setup?

Icom 21WAT (modified to xmit 432-)
20 Watt amp
Dual band "Vent" antenna. (looks like a roof vent pipe)

Let me add I can copy AO-21 VERY well!! My guess is I'll need more than 20 watts. I am thinking about replacing the "Vent" antenna with a J-pole (the one described in the ARRL Handbook). The only problem there is that I would have to mount the antenna in the attic. (I live in a very restrictive area)

Like I said, my guess is I need more power. I hate to go out and buy a big amp if this isn't going to solve the problem however.

Does anyone have any experience working AO-21 with a vertical? If so how much power should I expect it to take? Anyone using the dual band J-Pole from the ARRL handbook inside an attic?

Thanks in advance for any help anyone can offer.

73,
Eddie

KO-25 NASA Keps Track The Wrong Satellite

For the past several weeks many amateurs have noted that the NASA keps for KO25 have not produced accurate AOS and LOS times observes AMSAT-NA Orbital Data Manager Ray Hoad (WA5QGD). With the help of W5IU, K5EKH, and KG5OA, numerous KO-25 passes have been observed in conjunction with other objects in the KO-25 launch group. The consensus of this study is that the object NASA tracks as Catalog #22828 may actually be KO25.

In order to help remove this confusion, the keplerian elements for Catalog #22828 will be included (for the near future) in the weekly kep-lerian element set published on INTERNET. Please post any comments on the accuracy of the Cat. #22828 keps in tracking of KO25 as messages addressed to WA5QGD on either KO-23 or KO-25 digital satellites. The NASA Orbital Information Group has been advised of the tracking problem with KO25.

Note: The most accurate way to determine whether a transmitting satellite fits a set of keplerian elements is to observe the frequency of the satellite's transmission at the Time of Closest Approach (TCA). For low orbit birds, this corresponds to the time of maximum elevation given by most tracking programs. At this time there will be no doppler shift and the transmission frequency should match the published channel frequency (assuming no shift due to other causes). If a set of keps meets these requirements, it is a good match for the satellite. This method will give more consistent results than the AOS/LOS method.

[The AMSAT News Serive (ANS) wishes to thank Ray Hoad (WA5QGD) for this bulletin item.]

AO-13: Current Transponder Operating Schedule:
M QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Jul 11 - Sep 12
Mode-B : MA 0 to MA 90 | Omnis : MA 230 to MA 30
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 122 |<- S beacon only
Mode-S : MA 122 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 | Move to attitude 230/0, Sep 12
==========
N QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Sep 12 - Dec 19
Mode-B : MA 30 to MA 150 |<- OFF Oct 22 - Nov 07 for eclipses
Mode-B : MA 150 to MA 190 | max duration 2h 12m
Mode-BS : MA 190 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-B : MA 230 to MA 30 | Alon/Alat 230/0
Omnis : MA 250 to MA 140 | Move to attitude 180/0, Dec 19
The battery charge state is of paramount importance during the eclipse
seasons. As always the command team may have to have to make temporary
changes to the published schedule. In that case we will try to minimize
the inconvenience, setting Mode-B OFF from MA 230-256 in the first
instance.
==========
[G3RUH/DB2OS/VK5AGR]

DO-17: DOVE is running a new set of software that tests the
digital-to-analog converter (DAC) and other hardware and software cap-
abilities. It plays digitally generated tones through the DAC and exer-

cises software that implements two way communications between the on-board processors. [WD0E for the DOVE Team]

RS-10: RS-10 has been working very well. Lots of activity with 2 stations worked /MM I6KYL/MM EL27 and N1KTM/MM EL67. Also on the 28-JUL-94, WC9C heard the station KC6VRK who was on AO-13 as RS-10 pass underneath right after AO-13 went through its perigee; his signal was very strong on the 10M downlink. The CW Robot is back up and working just fine. Also, WA6ARA reports that RS-10 has been sending down excellent signals at his QTH with lots of stations using CW. [WC9C & WA6ARA]

AO-10: After last week's glowing report about AO-10 sending down excellent signals, ZL2TPO reports that AO-10 has started to "FM" very badly. Up until last week it has been operating quite well and there have been a number of stations operating. Please note that when AO-10 is "FMing," please refrain from using it. [ZL2TPO]

KO-25: WH6I reports that KO-25 was in some sort of "loader-mode" earlier in the week. Today, however, the BBS seemed to be working again, but he was unable to send any commands to it. WH6I has not seen anything to indicate what is going on. [WH6I]

LO-19: LUSAT-OSCAR-19 (LO-19) is still not running its BBS. [WH6I]

IO-27: WH6I still has not heard anything from ITAMSAT. [WH6I]

AO-16: Still going strong and very doing well. There is some gateway traffic on AO-16 but not enough to present any problem to other users and the file lifetime on the bird is still quite long. [WH6I]

KO-23: KO-23 is going strong and doing well. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ N0QCU. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

1236. DSP40

Newsgroup: rec.radio.amateur.space
Date: 1994-08-08 09:27:27 UTC
From: ken@fstop.csc.ti.com
Message-ID: <940808092728@ken_durham.sc.ti.com>
Source record: 27092

I tried out the Radio Shack DSP40 on AO-10 and AO-13 over the weekend. It would make a good addition to an older receiver for adding bandpass filtering. There was no noticeable distortion, delay, or noise reduction. There may have been some rejection of hetrodynes, but I couldn't detect it. The unit works fine as a steep skirted filter with very little ringing.

This is a step in the right direction (low cost), but the next model may be A LITTLE more useful.

THESE OPINIONS EXPRESSED BY ME ARE MINE ONLY AND DO NOT REFLECT THOSE OF MY EMPLOYER.

If at all possible I was wondering whether there was a means of obtaining
*the location and imagery of any weather satellites that are still operational
The group that I am workig with will need the following information on imagery from
geostationary weather satellites:

1. Focal length of cameras (in pixels)

2. Aiming data for the cameras

3. Preprocessing of images

4. Scheduling of image transmissions

Any information pertaining to the preeceeding will be greatly appreciated.
Feel free to offer up any advise for other sources for this information.

>to a few centimeters.

not quiet yet ... present DGPS navigation accuracies are in the 4-8
metre range. for centimetre accuracies, GPS surveying techniques are
required and i believe they take some time; more than is available
in, say, landing a 747.

>Errors of 100 meters are unacceptable.

without doubt ... but an error one could live with if it was a
fundamental limitation of the equipment. that it is *deliberate*
makes the blood boil...

You most likley will never be able to work through AO-21 with 20 watts and
a vertical/J-pole. You will need at least 100+ watts into a 40+ ele yagi.
The only reason you need this type of station is because that is what others
are using. Those stations will caputre the birds input, thus you will never
be heard. Its a shame, because 20 watts with a vertical is really all you need.

I purchased a DSP-40 for about 3 months too. The only disappointment is the fact that it has no real noise filter in it. I think it states that it has a 20db noise reduction. BULL!!! It has NO noise filter! I have discussed this with the RS guys. They state that the 20db "noise reduction" is the average noise reduction over the audio spectrum if you take into account the frequencies outside of the filter's bandpass. In that case you can get that from a 7 element Chebyshev!! I was told that there have been numerous complaints on this problem, in future versions they will "reword" the specifications. Other than that, it is worth the $80.

They use a CODEC chip to do the A/D. I found that the box is easly over driven. This of course causes disstortion. The removal of hetrodynes works great. Infact if you try listening to a cw signal in the ssb mode you will find it will get chopped up or removed depending on stenght of signal. Two things that fother me is the use of a mono head phone jack and the large difference in the audio level between phones and speaker. The headphone output was not design for the phones of the day.

1246. 2 meter CW uplink

Newsgroup: rec.radio.amateur.space
Date: 1994-08-08 19:18:52 UTC
From: gerheim@sonalysts.com
Message-ID: <3260es$h9g@hatch.sonalysts.com>
Source record: 27098

Some authors have recommended using an FM HT for a CW uplink on 2 meters.
the problem with this is that many HT's take about 200 msec. to generate
a carrier from the time they are keyed on. This makes the CW uninteligable.
I also own a 20 watt amp for the HT, and would like to know if there's a way
to key the amp, or even key the RF going *to* the amp. I feel I'm within
a few $ of a decent 2 meter uplink, but can't get the pieces together.

The AMSAT answer would be to just buy an all-mode XCVR. Why spend $200 on a hobby
when you can just as easily spend $5000!? ;-)

I believe that there are currently 25 GPS satellites currently at an
altitude of 12,539 miles. Depending on the configuration and competion of
the GPS network the accuracy of any given location may vary.

Hope this helps.

> Any help would be appreciated.

Either you have been misinformed, or I am missing something big. I
pretty well know that GPS signals aren't transmitted by any "base
stations" on land. They come from 12 or so satellites that are circling
the earth on low polar orbits. The receiver works by receiving the
signals from any three of these satellites at a given moment (which is
guaranteed on any point on the earth, due to the orbital configuration
of the satellites). Therefore, you don't have to worry about access to
GPS signals no matter where you are; New York City or Tibet doesn't make
any difference.

Unless you're talking about some other GPS ("General Pinpointing
Service"? :)) or a special land-based factor about GPS signals that I
wasn't aware of (like what you mean by "differential"), I am pretty sure
that what I have explained here is accurate.

Actually, you're both kinda "out there" somewhere. Differential GPS
uses land based transmissions in conjunction with the GPS sattelites
to resolve position information to a few metres accuracy. See the
story in last month's 73 magazine for more details.

>Greg KD6KGW

As the orbit of Oscar 13 continues to decay it is subjected to more and
more radiation. Although the actual predicted date of re-entry is after
the scheduled launch date of P3D, it is very doubtful that it will still
be operational at that time. Whether it will succumb to radiation or
begin to tumble from atmospheric drag and exactly when this might
occur is unknown. I don't know enough about AO-13's orbital characteristics
to hazard a guess as to when things might start to go sour but perhaps
someone more closely involved in AO-13's management might have an idea?

>Ergin Guney

Mr Guney, you are missing one of the biggest things about GPS if you have not yet stumbled on differential.

There are several ways of performing differential GPS surveying. The one Mr Brown was referring to involves a receiver at a known point. This computes the difference between the measured satellite ranges and the ranges expected. It can then output these differences in a format called RTCM-102. The corrections are sent to a roving unit by radio or satcom and the corrections applied. This technique overcomes SA and a number of the other error factors in GPS positioning and can therefore deliver accuracies of 1-5m depending on the sophistication of the receivers being used. There are some commercial companies operating differential base stations but one of the biggest such operations is the chain of stations being operated by the US Coast Guard - for details contact the GPS Information Centre - address posted to this newsgroup recently.

If you are looking for a digital filter that actually reduces broadband noise, I would highly recommend the JPS NRU-500. The advertised reduction is 20 db, which is measurable, and there is a very good vox circuit which does a job at distinguishing between noise and voice. The heterodyne reduction is also good. There are plenty of outputs on the back for audio equipment, tape recorders, etc., including VOX relay outputs.

1255. Two-Line Orbital Element Sets (TLE445)

Newsgroup: rec.radio.amateur.space
Date: 1994-08-10 03:30:36 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.776489436@afit.af.mil>
Source record: 27108

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Here's the scoop:

AMSAT.ORG Mailing List and Remailing Services
==========

revised: 7/2/94 kb5mu

AMSAT-NA (the Radio Amateur Satellite Corporation in North America) operates the Internet host AMSAT.ORG to provide for efficient communications between people interested in the amateur satellite program. At this time two services are provided: a message remailing service and a mailing list service.

In the future, an archive of files will be accessible by anonymous ftp or possibly by email. In the meantime, check the host ucsd.edu by anonymous ftp for AMSAT-related files. Consult your local guru for help on using anonymous ftp.

The message remailing service permits users to send each other mail on the Internet without keeping track of each other's Internet address. The remailing service allows each user to receive mail sent to the address callsign@amsat.org, where callsign is that user's amateur radio callsign, or other unique identifier. Mail sent to that address will be routed first to the AMSAT.ORG host at UCSD in San Diego, then remailed from AMSAT.ORG to the network address specified by the user. In most cases, this process delays the message by only a very few minutes.

The mailing list service groups subscribers into mailing lists to receive certain types of messages. There are public mailing lists available to anyone, and private mailing lists available only to certain people (for example, AMSAT Board of Directors members or PACSAT command stations). Currently the following public mailing lists exist:

ANS AMSAT News Service

This mailing list carries official news releases from the AMSAT News Service. These messages are posted in a form suitable for direct posting to a packet radio BBS system. Each message contains a Bulletin Identifier (BID), which permits the message to be introduced into the packet network at many places without resulting in

duplicate bulletins at any BBS. The primary purpose of this mailing list is to distribute ANS bulletins for redistribution (via the packet net or on AMSAT voice nets), but individuals may also subscribe for their own use. If your local packet BBS doesn't seem to get the ANS bulletins reliably, you are encouraged to post the ANS bulletins yourself.

Only authorized AMSAT News Service personnel should send messages to the ANS mailing list.

AMSAT-BB AMSAT bulletin board

This mailing list carries general AMSAT information. This information may NOT be suitable in content for transmission via amateur radio, so automatic reposting of AMSAT-BB messages to packet radio BBS's is discouraged. The purpose of this mailing list is to provide a forum for general discussion of any satellite-related topic.

Anyone may send messages to the AMSAT-BB mailing list. Simply address your message to amsat-bb@amsat.org, and it will be automatically forwarded to all subscribers to the AMSAT-BB mailing list.

Editors of publications should ask permission of the sender before publishing anything seen in AMSAT-BB elsewhere, unless the posting was obviously a public press release. However, posters should realize that anything posted to AMSAT-BB is essentially public.

KEPS Keplerian Elements mailing list

This mailing list carries official postings of Keplerian element sets for satellites of interest to radio amateurs. Like the ANS bulletins, these messages are posted in a form suitable for direct posting to a packet radio BBS.

Only authorized AMSAT News Service personnel should send messages to the KEPS mailing list.

NASAINFO NASA related information mailing list

This mailing list contains information about current and planned NASA space missions. Be forewarned: at times this mailing list delivers many large messages.

SAREX Shuttle Amateur Radio Experiment mailing list

This mailing list contains information and press releases pertaining to SAREX missions.

To obtain any of these services, just send a message to the address

listserv@amsat.org

This address may be reached from CompuServe MAIL as:

>INTERNET:listserv@amsat.org

For the moment, the maintenance of the AMSAT.ORG mailing lists and remailing aliases is done manually. Later, this service will probably be automated and you will have to follow a strict message format. For now, you may send requests in free format. They will usually be processed within a few days. In general, you will not receive an explicit reply to your request. Be sure you specify:

1. Which mailing list(s) you want to receive

2. Your callsign, if any

3. The Internet address to be used, if different from the one in your From: header.

You should not send messages about your subscriptions to any of the mailing lists. Send them to listserv@amsat.org instead. This includes questions, requests for changes, requests for information about mailing services, and complaints.

The list of amateurs who may be reached via the message remailing service may be obtained by requesting the "address book". Note that the address book as distributed contains only the callsigns of the available addressees, not their actual Internet addresses. The address book is updated occasionally, and does not necessarily contain the very latest information.

You may request to be added to the list, to be deleted from the list, or to have your Internet address changed on the list. Please include your callsign if you have one. If you don't have a callsign, that's OK, but please say so. If you have more than one Internet address you want to have available on the AMSAT.ORG remailer, you may so specify. For instance, if you have a regular Internet address and a CompuServe account, you may appear in the address book as both w1xyz and w1xyz-cis. Mail sent to w1xyz would go to your Internet address, and mail sent to w1xyz-cis would go to CompuServe. MCImail accounts have the form w1xyz-mci, and so on.

You may also subscribe or unsubscribe to any of the public mailing lists described above. Send a message to listserv@amsat.org, specifying clearly which mailing list(s) you want to add or drop, and giving your callsign if you have one. When you subscribe to a mailing list, you will automatically be added to the remailing service as well, because the mailing lists are maintained by callsign. If you have more than one address listed in the remailing service, please indicate which one(s) you want the mailing list messages sent to.

Additional mailing lists, public or private, can be set up as needed. Send mail to listserv@amsat.org for details.

Questions about any service offered by AMSAT.ORG may be directed to listserv@amsat.org as well.

Frequently-asked Questions and Complaints (and Answers):

1. Why do I get "MCI Mail Rejected a Message" responses each time I send a message?

MCI won't accept mail from CompuServe via the Internet. This is just corporate policy. There isn't anything we can do about it, short of banning MCImail addresses from the mailing lists.

2. Why did the mailing list messages suddenly stop coming to me a few weeks ago?

Something may have been temporarily wrong with mail delivery to your site. If a message to you bounces back to the list maintainer, you may be removed from the mailing list without notice. If you think this has happened to you, send a message to listserv@amsat.org and ask.

3. I never get an answer from w1xyz when I send him mail via AMSAT.ORG.

If his mail isn't getting delivered, you *should* receive some kind of automatic message indicating there has been a delivery problem. If you don't get such a message within a few days of sending your message, chances are that your message made it to the addressee's mailbox. However, the addressee may be behind on reading email, or may simply not bother to reply, and there isn't much we can do about that.

Another possibility is that the message you sent contains a bad "From:" address. This will prevent the recipient from replying to your message. If you suspect this may be happening, include your real Internet address in the text of the message. If you find that this is happening, please complain to your system administrator.

4. My computer says "unknown host" whenever I try to reach AMSAT.ORG.

This indicates a problem with domain name service. AMSAT.ORG *is* a fully official domain name, and your host should be able to find it. Check with your local network administrator (tell him to check the nameserver at ucsd.edu). As a workaround, you may be able to use an address of the form
callsign%amsat.org@ucsd.edu
to force the message to pass through the UCSD mail host on its way to AMSAT.ORG. If your local system can't find ucsd.edu, you're in trouble!

5. I have an important announcement I'd like to make. Can I send it to the ANS mailing list?

Not unless you're an official ANS station. You may send it to AMSAT-BB, and/or submit it to the ANS editor (wd0hhu@amsat.org) for possible inclusion in the next issue of ANS.

And no, the computer doesn't enforce this rule. You're on your honor.

6. I can't get Internet access!

Yes, you can. It may not be very easy or cheap, but you can. You have a number of alternatives:

* find a local connection. Most hams have inside connections they don't even know about. If you know somebody at the local university or at a high-tech company, ask them if there's any way for you to have access to the Internet through their system. Sometimes the answer will be yes. If you are in a position to grant access, *please* make this service available to local AMSAT folks.

* check with your local BBS. Some telephone BBS systems have access to a mail gateway that will allow you to send and receive Internet mail. This may not be the fastest way to receive the mailing lists, but it is probably the cheapest if you don't have free access.

* subscribe to a pay service. There are several systems that offer Internet access for a fee. CompuServe subscribers can find a list in the Internet library of the TELECOM Forum. AMSAT does not maintain a current list of public Internet providers.

* subscribe to a commercial service that provides Internet access. America Online, Genie, and Delphi are among such services. Check around to find the one with the rate structure that best matches the way you expect to use the system.

* subscribe to CompuServe. Many subscribers to the mailing lists receive their mail via CompuServe. This is an expensive choice, but it is very easy and available in most developed parts of the world. CompuServe is often a local telephone call, and they have an 800 number for people in the less-populated areas of the US. CompuServe starter kits are available at computer stores, and there's often one included free when you buy a modem.

CompuServe users can send mail to Internet addresses by adding
>INTERNET:
before the address. The ">" and the ":" are required, and "INTERNET" must be in uppercase. For example, to send mail to w1xyz, you can use the address
>INTERNET:w1xyz@amsat.org
from CompuServe MAIL. Note that there is no way to communicate between Internet and a CompuServe forum like HamNet. The Internet gateway only works for CompuServe MAIL.

There may be an additional surcharge for receiving messages from the Internet on CompuServe. As a CompuServe subscriber, your mail may also be subject to additional delays. Worse, CompuServe limits the amount of mail you can have pending in your mailbox, so you must read your mail frequently. Check with CompuServe for details.

7. There's too much XYZ being posted to mailing list ABC!

It's not possible for the mailing lists to contain exactly what you find interesting. If we are to share information freely, all subscribers must be prepared to cope with a certain amount of traffic they find boring or useless.

Sometimes it becomes a clear problem, with one subject generating so much traffic that it becomes a burden on a more general mailing list. In those cases, a new mailing list can be created to make it possible for only those who are interested to receive the information. However, there is a practical limit.

8. I posted a message to mailing list ABC, and I got a bunch of bounce messages back.

Most automatically-generated problem report ("bounce") messages should be automatically routed to the list administrator. These messages usually signal a transient problem somewhere in the network. Often, the problem is at the receiving end. If a particular subscriber generates repeated bounce messages, that subscriber will be removed from the mailing lists.

If by some mischance a bounce messages comes back to you, the poster of a message to one of the mailing lists, please forward the bounce message (or a sample if many arrive) to listserv@amsat.org. Please forward the entire message including headers as received. If the echoed text is large, you may edit it down, but preserve all headers and bounce message text.

Do NOT forward bounces resulting from sending messages from CompuServe to MCImail. There's nothing to be done about that.

9. How do I get a password for AMSAT.ORG?

You don't. There are no user accounts on AMSAT.ORG. When you get an alias on AMSAT.ORG, that only allows others to send mail to you as yourcall@amsat.org. It doesn't mean you have an account on AMSAT.ORG.

10. How do I log in to AMSAT.ORG?

You don't. There are no interactive services on AMSAT.ORG.

11. Is there anonymous FTP on AMSAT.ORG?

Not yet.

12. Do I have to be a member of AMSAT to take advantage of the services of AMSAT.ORG?

No, the services are available to anyone. Of course, you're encouraged to join your national AMSAT organization.

13. Is there any charge for AMSAT.ORG services?

No.

1257. Need help with weather satellites

Newsgroup: rec.radio.amateur.space
Date: 1994-08-10 19:21:27 UTC
From: cflarkie@sonalysts.com
Message-ID: <32b9bn$95b@hatch.sonalysts.com>
Source record: 26911

I was wondering if there was anyone out there who could help me with a project that I have been working on. A group that I am working with is researching the location of weather satellites (especially geostationary satellites) and their images. If anyone knows of any directories, files,or even groups that could be helpful please respond. The specific information I will need is:
1. focal length of the camera (in pixels)
2. the aim data for the camera
3. image processing
4. schedule of image transmissions
Thank you for your time and efforts!

1259. Homebrew Global Positioning System (GPS)

Newsgroup: rec.radio.amateur.space
Date: 1994-08-11 00:18:22 UTC
From: wmoyes@eis.calstate.edu
Message-ID: <32bqoe$ur@eis.calstate.edu>
Source record: 27110
Cross-posted to: alt.2600,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space

I need information for a homebrew GPS (Global Positioning System). Books, magazines, references, and internet resources would be extremely helpful. I need information on theory, frequencies and modulation, and circuit schematics. Although I would prefer to build my own, any information about commercially available units would be helpful (specifications, sources, and prices), however I will need to hook the output of the device into other equipment. I am also seeking good information on how to set up an experiential differential GPS system.

>dynamic officer on the ground) that it's fairly difficult to use -
>unless you're heavily into the shuttle program.

MacSPOC *is* designed specifically for the space shuttle (it's the Mac version of a program that flies on every mission), but I can't imagine why anyone would consider it difficult to use.

During each mission, Dan sends out checkpoints--the files that hold the current orbital information for the shuttle--as needed, depending on how often the orbit changes significantly during that mission. All you have to do is double-click on a checkpoint file. The program launches and displays the shuttle's orbital tracks. What could be easier?

Dan also sends out the appropriate earth observation lists and other files before each mission; again, you just plunk them into your MacSPOC folder and the program automatically calls them.

The older (now demo) version of MacSPOC is already available on AppleLink (K-12 Education:Education Resources:Science Resources), and it sounds like Terry is working on getting it to some FTP sites. Keep your eyes open for news from Terry and give MacSPOC a try!

Patty
(another satisfied longtime MacSPOC user)

Once a year? :-)
With meteors coming in 3 to 4 a minute, meteor scatter work on VHF may be
quite good. I suppose HF would be enhanced as well :-)

Karsten,

Is it for MSDOS only or Un*x?
What about the source code?
Need more detail information before to try ftp.

73 and thanks, Kohjin

1265. Temperature Telemetry

Newsgroup: rec.radio.amateur.space
Date: 1994-08-11 17:18:42 UTC
From: oflber02@uctvax.uct.ac.za
Message-ID: <1994Aug11.191842.1@uctvax.uct.ac.za>
Source record: 26920

I am currently doing a thesis on a Perishable Goods Temperature Monitor.
The thesis calls for a temperature probe which is packed with the goods.
An interrogator then interrogates the probe and a reading is given.
The problem is that the probe is not allowed to have a power source at all.
The interrogator is hand-held and is powered by a battery. An option is
to have a rechargeable set up.
The probe must be as light as possible and as small as possible.
The system must be able to read temperatures between 233K and 313K
with an accuracy of 0.5K
I have thought about using a telemetry system or a transponder.
I have thought about using magnetic, acoustic, RF or microwave coupling
but I do not think I will be able to get enough power from a meter away
to power a IC like the LM35.
The interrogator must be able to receive the temperature from a meter away.
The only thing I have thought of that might work is an oscillating circuit.
The oscillation frequency changes with temperature.
A dip meter is then used as the interrogator.
The only problem is that the only thing I can think of that will vary with
temperature is a bimetallic strip.
The strip can then be used to change the capacitance of the oscillating
circuit.
However I need a circuit for a dip meter which can constantly scan the
frequency range and be able to differentiate the dips so that the required
accuracy is obtained.
Any help or ideas and suggestions are needed and very welcome.
Please send mail to
oflber02@Uctvax.uct.ac.za
Thanks in advance

1266. Where to find Satellite Freqs-Info

Newsgroup: rec.radio.amateur.space
Date: 1994-08-11 21:45:55 UTC
From: apple.com
Message-ID: <apple.com-110894144555@goofy-2.apple.com>
Source record: 26919

I am new to this field and have some questions. I would like to know where I can find a listing of all satellites and their frequencies. I have been using Orbitrack to visually locate some satellites but would like to use my scanner to listen in. Eventually, I will upgrade to a ground station. What magazines are best for general satellite info.

Thanks..

Hi there:
I'm new to this so please bear with me. Here's a question that I'm
sure you get quite a lot. Where can I find a list of uplink/downlink
freqs for ALL the amsats? In particular, ones I can download schedule,
and or download images of the Earth from.
Thanks

Hi William

Try the european "VHF communication" magazine; they are beginning a serie of papers about a homebrew GPS

Hope this will be useful

published every week and is made available for unlimited distribution.

* STS-68 LAUNCH DATE SET *
==========
NASA managers have selected August 18 as the official launch date for
Shuttle mission STS-68, the second Space Radar Laboratory flight. Liftoff
is planned for 6:54 AM EDT at the opening of a two hour, 30 minute window.
The mission is scheduled for 10 days, with a planned landing on August 28.

STS-68 will be the seventh flight of orbiter Endeavour, and the 64th mission
of the Space Shuttle program. Commander Mike Baker heads a six person crew
which will operate in two shifts for continuous scientific data gathering
during the mission. Other crew members are pilot Terry Wilcutt, and mission
specialists Steve Smith, Dan Bursch, Jeff Wisoff and Tom Jones who flew on
the first successful SRL mission in April.

Endeavour's primary payload will be the Space Radar Laboratory, part of a
comprehensive effort under NASA's Mission to Planet Earth program, to
understand how the Earth's environment is changing.

[Info via NASA]

* MIR NEWS *
============
The Soyuz-TM20 spacecraft will be launched to the Mir space station on
03-Oct-94 carrying a European cosmonaut who will remain on Mir for 30 days.
The visiting cosmonaut will conduct experiments relating to life sciences
including the monitoring of the human body in microgravity conditions.

The launch of the Progress-M24 cargo vehicle to Mir that was originally
supposed to be launched during the July/August 1994 time frame has been
postponed because of economic reasons. Progress-M24 is now expected to be
launched on 24-Aug-94 and will deliver the normal cargo to the Mir complex
in addition to equipment to be used by the European cosmonaut (Ulf Merbold

or Pedro Duque) during the EuroMir94 mission in October 1994.

[Info via Chris v.d. Berg, NL-9165/A-UK3202]

* DC-X TO BE REPAIRED *
==========
The DC-X launcher has been in limbo since it was damaged in a ground equipment induced explosion. According to Charles "Pete" Conrad, who is with the McDonnel-Douglas test program, the DC-X vehicle is to be returned to California for repairs so that the flight test program can be resumed.

[Info via Andy Reynolds, WD9IYT]

* VE3ONT ADDS 50 MHz EME *
==========
As a result of discussions at the recent meeting of the Central States VHF Society, the Toronto VHF Society (VE3ONT) has added 50 MHz to the list of bands to be used in the upcoming EME contest. 50 MHz will on the air on a non-interference basis simultaneously with 1296 MHz on Sunday of the first EME contest weekend.

VE3ONT will use the 46m (150') dish operated by the Institute for Space and Terrestrial Science at Algonquin Park (FN05xw). On 50 MHz, the antenna will be linearly polarized, and output power will be 1 kW.

UTC Date VE3ONT TX freq listening range approx. times

Oct 29 432.050 MHz 432.050 - 432.060 0645 - 1815 UTC
Oct 30 1296.050 1296.050 - 1296.060 0754 - 1844
Oct 30 50.100 50.100 - 50.105 0754 - 1844

Nov 26 144.100 144.100 - 144.110 0538 - 1645
Nov 27 144.100 144.100 - 144.110 0646 - 1713

Because the Algonquin dish has a 9 degree lower elevation limit, stations with horizon-only antennas in eastern North America will have a limited chance to work VE3ONT. VE3ONT requests that az-el capable stations in Europe and North America delay their QSOs with VE3ONT until after moonrise/moonset windows. This will allow the many horizon-only stations a better chance of making an EME QSO during the limited time available.

Link budget calculations show that 50 MHz stations with 10 dBd (6 elements or so) beams and 1 kW should be able to work VE3ONT off the Moon; smaller stations are urged to try as well.

Use of the dish at the Algonquin Space Complex is always subject to last minute preemption for non-Amateur purposes.

QSLs with an SAE to Dennis Mungham VE3ASO, RR 3, Mountain, Ontario, Canada, K0E1S0. Reception reports are also welcome. Send your log to the ARRL.

For further information contact Peter Shilton VE3VD, (905) 774-8766. Latest developments will be provided at the International EME Conference, Gottskars, Sweden, August 26-28.

>a few $ of a decent 2 meter uplink, but can't get the pieces together.

A MOPA set. :-)

Sure you can key the amplifier. Key just the PA transistor B+ unless you
like to hear relays clank. You'll have to manually TR. You'll likely need
a click filter in the keying line and a key that can handle 3 or 4 amps.
Old Navy keys with coin silver contacts would be ideal. A multistage amp
would be easier, you could just key the driver rather than the PA and
have to switch less current.

Gary

: to set up an experiential differential GPS system.

I had an idea. How about linking up a GPS with a cellular phone and
a large battery to power both for a couple of days. Then dial a number
on the cellular where you want the GPS to send it's location info and
drop the whole bundle into someone's car. Since GPS info can be used
with several very cheap street mapping systems (Delorme for one) you'll
be able to sit at home and watch them driving down the street on
your home computer. Should be able to do this cheap. A couple of
hundred dollars (with cheap GPS and cheap phone). I have no ideas
on keeping cellular costs down though. One thought would be to set
the phone to answer and power up the whole gizmo and then shut down
after a call is placed into it. You wouldn't get a continuous
signal but you'd be able to find where someone is on demand (if they're
within cellular calling range). Such a setup could last for a LONG
time with the proper battery.

1277. Galileo SL-9 Impact Image

Newsgroup: rec.radio.amateur.space
Date: 1994-08-12 20:47:00 UTC
From: towheed@nssdca.gsfc.nasa.gov

Source record: 26930

FIRST GALILEO SL-9 "JAILBAR" IMAGE AVAILABLE AT THE NSSDC

The National Space Science Data Center (NSSDC) at NASA's Goddard Space Flight Center is pleased to announces the availability of the latest Comet P/Shoemaker-Levy 9 impact images taken by the Galileo spacecraft.

The images can be obtained using the World Wide Web (WWW) via the URL below.

http://nssdc.gsfc.nasa.gov/sl9/comet_images.html

As of 4:00pm EST, August 12, 1994 we only have the first "Jailbar" image, but we will be providing the full resolution images as soon as they become available.

1278. Two-Line Orbital Element Sets (TLE448)

Newsgroup: rec.radio.amateur.space
Date: 1994-08-12 23:57:02 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.776735822@afit.af.mil>
Source record: 26932

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

I have a 28H and the user manual. Send your address via E-mail
(not public posting) and I will copy the manual and send it to you.
If you wish to order from ICOM, call the 800 directory assistance
operator, and ask for their number. It's ICOM America in Bellvue,
Washington.

You aren't going to be able to get a GPS and cell phone for a couple hundred dollars. The cheapest GPS receivers are around $400, and so are cell phones unless you roll their cost into a long term service contract. And monthly and per minute cell phone charges will mount up fairly rapidly. By using packet radio, amateur or commercial, you can send position updates on a regular basis without incurring quite as much cost.

DeLorme Mapping and City Streets are a couple of commercial map systems that work with GPS. However, APRS (Automatic Packet Reporting System) is in some ways better. While it lacks the friendly user interface of the commercial products, and it's pre-made map databases are skimpy, you can make your own maps, and it works with local and remote GPS receivers (using packet UI frames for the latter). It also supports other information about the remote sites such as range and bearing data from DF equipment, and arbitary text messages.

However, what many of us want is *differential* GPS. The Coast Guard, FAA, and others send out position deltas from a fixed benchmark receiver that are received and used to correct the reading of the local GPS receiver. These transmissions are either at MF or VHF depending on the system. A special receiver is required, and either a GPS receiver designed to work with differential signals, or a PC that can take the timestamped position reports and reconcile them via software, is used to give a true position. This method removes the deliberate SA jitter, and other error sources such as varying atmospheric propagation factors,

from the position data. This allows much greater precision in determining location than raw GPS alone.

It would be nice if the APRS author would support this mode in his software. Some of us are willing to set up benchmark receivers on the amateur bands. That timestamped data could be used to correct the positions reported by the rover receivers over packet.

Everyone should have an idea occasionally... :=)

Well, this is, unfortunately, not a new idea. The similar systems I'm already
familiar with sell for ~$2000, which tells me that they are costing about $1k
for hardware PLUS s/w and R&D.And don't have much markup.

Actually, if you shop carefully, the DGPS without a fancy display costs $318.
Quantity 1. It's a Motorola VP Encore core modure, and it runs on 5 VDC
(regulated), puts out TTL levels, and can receive RTCM-104S differential
updates with Option B installed (for no cost, I might add!). Further, with
Option B, it will put out the differential correction data, acting as a
reference station, albeit in Motorols Proprietary Binary format. The
developers' manual has the full data format, making translation to the
standard format pretty straightforward.

The cellphone could be the hard part, from a cost perspective. I've not
looked into that, because there aren't too many cell sites near the ranch I'm
where I'm putting GPS's on cows.

Very true. In fact, it's seriously impressed the GIS institute here at Texas A&M (Nice Job, Bob!).

Er. Ah. See above. Differential is getting easier and cheaper. A local ham club could go together, get a cheap GPS core, throw together an embedded PC clone for translation, and broadcast the results on packet. Now, if you want to get really fancy, use carrier-phase to get the roaming units a little smoother, AND incorporate DGPS.

>It would be nice if the APRS author would support this mode in his

And, of course, if you want to, one can log DGPS corrections over a local area and post-process the logged fixes from the mobile units, to give DGPS corrected data. That's one of the standard methods used today. I don't personally think APRS is the appropriate place for DGPS post-processing corrections...

Where can I get more information about this device and the developers'
manual? This sounds very interesting!
>
>The cellphone could be the hard part, from a cost perspective.

In California, various places are selling the bottom-of-the-line Motorola
portable cellphone for $100, with no activation required. (CA has a law
prohibiting anyone from requiring the purchase of cellular service with
a phone. However, you do get a VERY nasty look from the salesperson
when you say "No, I just want the phone.") It's almost getting to the
point where it's worth investigating what it would take to put one of
those phones on the 900 MHz ham band.

Incidentally, one of the earlier posters in this thread mentioned tracking
vehicles using the GPS/cellphone system. We had a demonstration here a
couple of months ago in which a ham put a GPS/APRS system in his wife's
car, and produced the resulting map for the local packet users group. The
map provided an every-two-minutes location for the car for an entire
day.

AI> What's the best frequency (and any tips) to hear Perseid meteors on
AI> receivers?

Hello David, Well during some if not most of the Meteor events here in the States I've used the FM Broadcast band 88-108 Mhz and Tune in stations that are over the Horizon. As for HF Frequencys during the major Meteor Events like the Perseid's Ive also detected Propagation Beacons on the 10 Meter band 28.2-28.3 these are almost always low power simple antennas. With these if the Band is dead You can sometimes hear them Ping out of the Noise for as long as several Minutes. GL.

A MOPA set. :-)

Sure you can key the amplifier. Key just the PA transistor B+ unless you
like to hear relays clank. You'll have to manually TR. You'll likely need
a click filter in the keying line and a key that can handle 3 or 4 amps.
Old Navy keys with coin silver contacts would be ideal. A multistage amp
would be easier, you could just key the driver rather than the PA and
have to switch less current.

Gary

FIRST GALILEO SL-9 "JAILBAR" IMAGE AVAILABLE AT THE NSSDC

The National Space Science Data Center (NSSDC) at NASA's Goddard Space Flight
Center is pleased to announces the availability of the latest Comet
P/Shoemaker-Levy 9 impact images taken by the Galileo spacecraft.

The images can be obtained using the World Wide Web (WWW) via the URL below.

http://nssdc.gsfc.nasa.gov/sl9/comet_images.html

As of 4:00pm EST, August 12, 1994 we only have the first "Jailbar" image, but
we will be providing the full resolution images as soon as they become
available.

You aren't going to be able to get a GPS and cell phone for a couple
hundred dollars. The cheapest GPS receivers are around $400, and so
are cell phones unless you roll their cost into a long term service
contract. And monthly and per minute cell phone charges will mount
up fairly rapidly. By using packet radio, amateur or commercial,
you can send position updates on a regular basis without incurring
quite as much cost.

DeLorme Mapping and City Streets are a couple of commercial map
systems that work with GPS. However, APRS (Automatic Packet Reporting
System) is in some ways better. While it lacks the friendly user
interface of the commercial products, and it's pre-made map databases
are skimpy, you can make your own maps, and it works with local and
remote GPS receivers (using packet UI frames for the latter). It also
supports other information about the remote sites such as range and
bearing data from DF equipment, and arbitary text messages.

However, what many of us want is *differential* GPS. The Coast Guard,
FAA, and others send out position deltas from a fixed benchmark
receiver that are received and used to correct the reading of the local
GPS receiver. These transmissions are either at MF or VHF depending on
the system. A special receiver is required, and either a GPS receiver
designed to work with differential signals, or a PC that can take the
timestamped position reports and reconcile them via software, is used
to give a true position. This method removes the deliberate SA jitter,
and other error sources such as varying atmospheric propagation factors,
from the position data. This allows much greater precision in determining
location than raw GPS alone.

It would be nice if the APRS author would support this mode in his
software. Some of us are willing to set up benchmark receivers on
the amateur bands. That timestamped data could be used to correct
the positions reported by the rover receivers over packet.

Subject: Question on AO-21
To: ham-space@ucsd.edu

I'm kinda new to amateur radio and OSCAR. I am interested in using AO-21.
I've been doing some reading about the LEO sats, and most of the information

I've read indicate one should be able to work them with a vertical. I have however, been having a few problems. So, I thought I'd post a question or two.

Is it realistic to expect to work AO-21 with the following setup?

Icom 21WAT (modified to xmit 432-)
20 Watt amp
Dual band "Vent" antenna. (looks like a roof vent pipe)

Let me add I can copy AO-21 VERY well!! My guess is I'll need more than 20 watts. I am thinking about replacing the "Vent" antenna with a J-pole (the one described in the ARRL Handbook). The only problem there is that I would have to mount the antenna in the attic. (I live in a very restrictive area)

Like I said, my guess is I need more power. I hate to go out and buy a big amp if this isn't going to solve the problem however.

Does anyone have any experience working AO-21 with a vertical? If so how much power should I expect it to take? Anyone using the dual band J-Pole from the ARRL handbook inside an attic?

Thanks in advance for any help anyone can offer.

73,
Eddie

Subject: Where to find Satellite Freqs-Info
To: ham-space@ucsd.edu

I am new to this field and have some questions. I would like to know where I can find a listing of all satellites and their frequencies. I have been using Orbitrack to visually locate some satellites but would like to use my scanner to listen in. Eventually, I will upgrade to a ground station. What magazines are best for general satellite info.

Thanks..

Everyone should have an idea occasionally... :=)

Well, this is, unfortunately, not a new idea. The similar systems I'm already
familiar with sell for ~$2000, which tells me that they are costing about $1k
for hardware PLUS s/w and R&D.And don't have much markup.

>You aren't going to be able to get a GPS and cell phone for a couple
>hundred dollars. The cheapest GPS receivers are around $400, and so
>are cell phones unless you roll their cost into a long term service
>contract. And monthly and per minute cell phone charges will mount
>up fairly rapidly. By using packet radio, amateur or commercial,

>quite as much cost.

Actually, if you shop carefully, the DGPS without a fancy display costs $318.
Quantity 1. It's a Motorola VP Encore core modure, and it runs on 5 VDC
(regulated), puts out TTL levels, and can receive RTCM-104S differential
updates with Option B installed (for no cost, I might add!). Further, with
Option B, it will put out the differential correction data, acting as a
reference station, albeit in Motorols Proprietary Binary format. The
developers' manual has the full data format, making translation to the
standard format pretty straightforward.

The cellphone could be the hard part, from a cost perspective. I've not
looked into that, because there aren't too many cell sites near the ranch I'm
where I'm putting GPS's on cows.

>DeLorme Mapping and City Streets are a couple of commercial map

Very true. In fact, it's seriously impressed the GIS institute here at Texas A&M (Nice Job, Bob!).

>However, what many of us want is *differential* GPS. The Coast Guard,

>to give a true position. This method removes the deliberate SA jitter,
>and other error sources such as varying atmospheric propagation factors,
>from the position data. This allows much greater precision in determining
>location than raw GPS alone.

Er. Ah. See above. Differential is getting easier and cheaper. A local ham club could go together, get a cheap GPS core, throw together an embedded PC clone for translation, and broadcast the results on packet. Now, if you want to get really fancy, use carrier-phase to get the roaming units a little smoother, AND incorporate DGPS.

>It would be nice if the APRS author would support this mode in his
>software. Some of us are willing to set up benchmark receivers on
>the amateur bands. That timestamped data could be used to correct
>the positions reported by the rover receivers over packet.

And, of course, if you want to, one can log DGPS corrections over a local area and post-process the logged fixes from the mobile units, to give DGPS corrected data. That's one of the standard methods used today. I don't personally think APRS is the appropriate place for DGPS post-processing corrections...

AMSAT-UK Colloquium Report: Part 1

AMSAT-UK's annual Colloquium was held at the University of Surrey between 28th to 31st July 1994; over 133 people came from 22 countries in five continents to attend this Colloquium.

The University of Surrey personnel gave several talks about their equipment and the science they are conducting. Noteworthy points about their thinking include: low-cost propulsion (hybrid motors); mini-sats (up to 200 Kg) rather than MICROSATs; higher data rates; use of S-band; GTO, or modified GTO orbits; spread spectrum. One of their approaches to building less expensive satellites was the subject of one paper. It involves the use of commercial grade battery cells. A single space qualified NiCd cell costs about $4000. Surrey buys commercial cells for about $12 each and qualifies them for space use in house, with a resultant cost per cell of less than $1000.

Doug Loughmiller spoke about the S-band beacon on UO-11 which has been switched on for a considerable time; but he has had no reports on it, and appealed for folks to let him know if they hear the beacon, or even if they listened but could not hear it.

Doug also provided an explanation of some of the more obscure codes seen on-screen from UO-22:

F: available space in program memory
L: largest free part of ---''---
TST: transputer status
d: digipeater (0=off)
B: bytes transmitted
Uptime: lifetime of current operations (Days/hours/minutes)
SPIN: 10.1K12G3.2 = 10.1 seconds for one revolution; earth magnetic field model 12; gamma angle (largest offpoint of libration since midnight) 3.2 deg

Ray Soifer W2RS gave a presentation regarding the US Government's intention to "sell" parts of the 2400 MHz band. Concern was expressed by many of the attendees with respect to any such attempt.

James Miller, G3RUH, gave a resume of AO-13's status. He pointed out that, since the proton event of Nay 13th, EDAC counts have been consistently higher than previously. He stressed, however, that AO-13 should continue working up to re-entry. Nevertheless, the effects of drag, once perigee starts to get quite low, are uncertain.

Gerard Auvray, F6FAO, talked about ARSENE which has now been abandoned. He said that the cable between 2M the equipment and antenna was changed just before launch. The suspicion is that a connector was not tightened properly. He also said that there is a new plan, involving a four to five year time-scale, to build a "micro-sat" carrying a Mode l/S linear transponder, this time using the low end of the 2.4 GHz band. A camera may also be incorporated.

A representative from AMSAT-OZ gave a presentation about their replacement for the Kansas City Tracker. The software takes four bits from an IBM PC parallel port and controls the rotors via opto-couplers. It was said that the cost to build is about $20 to $25. The device works on an open loop principle whereby positioning is determined by knowing the time it takes for the rotor to move a specified distance. One can re-calibrate this by moving the rotor to its stop. It was admitted that this approach is not as precise as the Kansas City tracker and similar devices, but it is acceptable for antenna beamwidths greater than
about 20 degrees. The program can also use a tracking table. AMSAT-OZ will be supplying these to AMSAT-UK for international distribution with profits going to AMSAT-UK's Phase-3D fund. AMSAT-UK will make an announce-ment once stocks are to hand.

[The AMSAT News Service would like to thank Richard Limebear (G3RWL) and Ray Soifer (W2RS) for their help in preparing this bulletin item.]

AMSAT-UK Colloquium Report: Part 2

Phase-3D papers were presented by Keith Baker KB1SF, Peter Guelzow DB2OS, Karl Meiner DJ4ZC (read by DB2OS), Mike Dorsett G6GEJ and Hans van de Groenendaal ZS5ALE. KB1SF's talk concentrated on the work going on here in the U.S. with emphasis on current progress in getting the spaceframe, now at the Orlando Integration Facility, ready to receive modules. Peter Guelzow's paper dealt with the electronic modules to be included on the satellite, especially the RF equipment.

Future ANS bulletins will carry additional details regarding the Phase 3D subjects presented.

Other Future Spacecraft

Several new satellite projects were announced. One is a non-Amateur spacecraft for the Chilean Air Force called FASAT.

Sias Mostert, ZR1MS, of the University of Stellenbasch, presented a paper on a South African satellite called "SunSat". It measures 45 x 45 x 40 cm and weighs 50 Kg. Current plans call for its launch in January 1996 on a U.S. Air Force Delta mission into eccentric polar orbit measuring 400 by 800 km with a period of 100 minutes. In addition to the usual VHF/UHF (Mode u/v) communications at 1200 and 9600 bps, SunSat is said to have a capability for Mode l/s. The 2401 MHz transmitter is expected to have five watts output and use QPSK modulation and have capability for a 40 Mbps wideband digital downlink intended to transmit video images. It was noted that sufficient bandwidth for experiments such as this is not likely to be available in the 2.4 GHz band if the U.S. NTIA/FCC proposals, currently being discussed, are adopted. The spacecraft will have a conventional power system, reaction-wheel attitude control, and 64 Megabits of RAM for its 80188, 80386 computers and T-800 transputer. The imager payload will consist of a linear array CCD camera producing 8000 pixels in a moving swathe. A resolution of 50 meters per pixel is expected.

AMSAT-UK Colloquium Report, Part 3: International Satellite Issues

The International Satellite Meeting was chaired by G3AAJ and convened at Thursday evening. A consensus was reached regarding the relationship between the international satellite community and the IARU. This was reflected in a resolution, which reads as follows:

INTERNATIONAL SATELLITE MEETING

INTRODUCTION

The International meeting of the AMSAT Groups hosted by AMSAT-UK at the University of Surrey on 28 July, 1994 expressed concern about the manner in which the services of the IARU Satellite Coordinator were terminated.

It was resolved that:

1. The IARU Administrative Council be urged to create the following positions:

- IARU SATELLITE LIAISON OFFICER

- IARU SATELLITE COORDINATOR

2. The Satellite Coordinator be appointed by the IARU Administrative Council on recommendation of the above mentioned International meeting.

3. The Satellite Liaison officer be appointed by the IARU Administrative Council.

4. The IARU Satellite Coordinator reports to the IARU Satellite Liaison Officer and that he shall be re-imbursed reasonable expenses in accordance with established procedures.

5. It is the express task of the IARU Satellite Coordinator to work closely with AMSAT groups as per terms of reference.

6. The meeting recommends that Freddy de Guchteneire ON6UG be appointed to the position of IARU Satellite Coordinator. Such as appointment to be made by the IARU Administrative Council at the September 1994 meeting.

R.J.C. Broadbent, G3AAJ
Chairman of the International Meeting

It was reported on Friday afternoon that ON6UG, who was not present at the meeting, but he had been contacted by telephone and was in agreement with the meeting's recommendation.

It was decided that, if the satellite's owners agree, POSAT should no longer be referred to as OSCAR 28 since it has been withdrawn from amateur use, but that the number 28 shall be reserved in case POSAT is returned to amateur use in the future.

On Sunday afternoon, Ivan, OZ7IS, chairman of the IARU Region 1 VHF Committee, reported on the Committee's "lengthy discussion" concerning SAREX and MIR. The Committee decided to recommend that, if possible, the downlink be moved to 145.80 and a European voice uplink be introduced at 145.20. The problem is mainly one of terrestrial QRM to the downlink due to the heavy use of 145.55 in Europe for FM simplex operation. The recommendation has been conveyed to the SAREX Working Group.

At the end of the Colloquium the award for the best paper went to James Miller G3RUH (AO-13) and second place went to Leonid Labutin UA3CR (SAREX in Moscow).

This having been the ninth and final Colloquium that Ron Broadbent G3AAJ has organized, Ron was thanked by one and all for his superb performance over the years. Next year's Colloquium, to be organized by Doug Loughmiller G0SYX, will be held 26-29 July 1995.

[The AMSAT News Service would like to thank Richard Limebear (G3RWL) and Ray Soifer (W2RS) for their help in preparing this bulletin item.]

Weekly OSCAR Status Reports: 13-AUG-94

AO-13: Current Transponder Operating Schedule:
M QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Jul 11 - Sep 12
Mode-B : MA 0 to MA 90 | Omnis : MA 230 to MA 30
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 122 |<- S beacon only
Mode-S : MA 122 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 | Move to attitude 230/0, Sep 12
==========
N QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Sep 12 - Dec 19
Mode-B : MA 30 to MA 150 |<- OFF Oct 22 - Nov 07 for eclipses
Mode-B : MA 150 to MA 190 | max duration 2h 12m
Mode-BS : MA 190 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-B : MA 230 to MA 30 | Alon/Alat 230/0
Omnis : MA 250 to MA 140 | Move to attitude 180/0, Dec 19
The battery charge state is of paramount importance during the eclipse seasons. As always the command team may have to have to make temporary changes to the published schedule. In that case we will try to minimize the inconvenience, setting Mode-B OFF from MA 230-256 in the first instance.
==========
[G3RUH/DB2OS/VK5AGR]

RS-10: A couple of weeks ago WC9C pointed out that RS-10's 10M downlink signals were sounding quite weak in comparision to a few months about. G3IOR thinks that the problem of weaker distant and stronger distant signals from RS-10 attributed by WC9C to the parent satellites attitude is due more to path attenuation. In the summer we have spread "E" layer levels of far higher intensity. At low angles of incidence, i.e. when the satellite is close to horizon, the path through these attenuating layers is extended, thus producing a much weaker signal, more than can be accounted for by the inverse square rule. When the satellite is close to overhead, the path is minimal, and also far less refraction, reflection and absortion results. RS-10 antenna is close to omni-directional, with only the odd end-on tip effect momentarily reducing the downlink level during it's slow rotation. At night, when the ionization is markedly reduced, signals are nominal. [G3IOR @ GB7VLS]

AO-16: AO-16 is going strong with no problems. [WH6I]

LO-19: LO-19 still seems have its BBS turned off. [WH6I]

IO-27: WH6I still has not heard anything from IO-26 and is afraid that it might stay that way permanently. [WH6I]

AO-16: Still going strong and very doing well. There is some gateway traffic on AO-16 but not enough to present any problem to other users and the file lifetime on the bird is still quite long. [WH6I]

KO-23: Since yesterday KO-23 seems to be down. Yesterday the 9600 baud signal sounded normal, but there was no data on it. Today the signal sounds abnormal. N4NR also reports that KO-23 is in a mode that leaves TNCs and DSPs locked up until a cold reset at the groundstation after the pass is over. Signal strength is good, however. [WH6I & N4NR]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ N0QCU. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

Telephone GEC Plessey semiconductors on (408) 438 2900 and ask them about availability of the GP1010 and GP1020 ICs and GP1010 evaluation board. The GP1010 is a receiver on a chip (just add clock and sprinkle lightly with passives) the GP1020 is a correlator that decodes the spread spectrum signal. You will need to design and build your own interface to your development PC of whatever though.

As for information about signal structure etcetera, go to your library and look for anything by J.J.Spilker, issues of GPS world and (unlikely in the US) copies or Electronics World (UK publication) for about 18 months ago. If you can get the annual report from the Institute of Navigation (ION) so much the better. An excellent introduction to GPSs. As for GPS resources, well, there is a GPS UseNet group (can't recall off hand exactly what), but that is mainly uses of GPS and reviews/opinions of particular devices.

Mike.

Hello,

I am a cadet at the US Air Force Academy and I am doing a research project where we will be launching a hybrid rocket. I am in charge of getting telemetry from this experimental rocket. But, since this is a college project we don't have the cash for expensive telemetry projects.

What I need to know is if the amateur radio community would have a cheeper alternative to this. I need to send info from sensors on the rocket to a ground station and then put the info into a digital form on the computer to analyze it. Is there a way to do this using the technology and equipment in the amateur radio community.

Please any information, suggestions, or a starting point would be greatly appreciated.

thank you,
Bill

1290. Az-El rotor for sale

Newsgroup: rec.radio.amateur.space
Date: 1994-08-15 14:30:33 UTC
From: gregg@plains.nodak.edu
Message-ID: <CuKyyx.DME@ns1.nodak.edu>
Source record: 26942

I have a new, only taken out of the box for inspection, az-el rotator. It is a Dynetic Systems DR10.
New list price from the company in Elk River Mn is $1395! I'd like to get $800 or best offer.
I'll pay shipping. It appears to be a very heavy duty system. It should hold a large, heavy satellite array.
Email for info, specs.

1291. Perseids data for MS-Soft

Newsgroup: rec.radio.amateur.space
Date: 1994-08-16 10:18:41 UTC
From: jsi@vipunen.hut.fi
Message-ID: <32q3q1$964@nntp.hut.fi>
Source record: 26944

Perseids data files available !

Perseids 1994 data files for OH5IY's MS software are available via ftp at
ftp.funet.fi:/pub/ham/vhf-work/msdata94.zip. This file contains currently
only Perseids '94 data, data for all earlier showers is included in v4.2e
which is the latest version of this software (available at same address).
Place the data files as /msdata/per94.b1 and /msdata/per94.m1.

Perseids 1994 as seen from these graphs (measured at 87 MHz):

The first peak occured on Aug 12 at 10-11 UT (max number of bursts at 10 UT,
max total reflection time at 11 UT). The first peak was very good for about
4 hours or so (09-13 UT). MS-Soft v4.2e predicted this peak to be at 1020 UT,
not bad !!! No suprise, the peak was lower than last year.

The second peak occured on Aug 13 at 03 UT. This peak was somewhat lower
than the first one but broader. Good reflections for about 10 hours (01-11 UT).

NOTE: Perseids 1994 data files are not comparable with 1993 files due to
changes in the measurement system on Sept 1, 1993.

1292. How to phase two loops for satellite

Newsgroup: rec.radio.amateur.space
Date: 1994-08-16 20:57:23 UTC
From: Tom WB7ASR <tom_boza@ccm.hf.intel.com>
Message-ID: <32ra2i$o9@chnews.intel.com>
Source record: 26945
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.antenna

I want to homebrew a M2 type eggbeater antenna for the 10 meter RS satellites downlink, however I not quite sure on how to tie them together at the feed point.

The eggbeater antenna is two circular loops at 90 deg to each other, both feed 180 out of phase, into a 50 ohm coax feed. The phase will determine if its right or left hand circularty polorized overhead. I don't want to use 75 or 93 ohm coax delay lines, to bulkey. I would rather use some sort of small L/C circuit what I can mount into a small 1x2 inch box with a SO239 on it. This is for receive only, so RF power handling capabilities is not a concern. I've seen this done at a field day site, however I didn't get the configuration of the box.

Any diagrams, part values or just ideas are welcome.

1294. STS-68 - SAREX?

Newsgroup: rec.radio.amateur.space
Date: 1994-08-17 13:51:37 UTC
From: rjgrocho@aud.alcatel.com
Message-ID: <32t4l9$ee1@fozzy.aud.alcatel.com>
Source record: 26947

I haven't yet seen anything that sez STS-68 will be a SAREX mission.
Is it? Tnx.

Robert - N5UPF

1295. Where can I find RG-302 & RG-303 ?

Newsgroup: rec.radio.amateur.space
Date: 1994-08-17 14:53:52 UTC
From: Tom WB7ASR <tom_boza@ccm.hf.intel.com>
Message-ID: <32t97o$h80@chnews.intel.com>
Source record: 26948
Cross-posted to: sci.electronics,rec.radio.swap,rec.radio.amateur.swap,rec.radio.amateur.space,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.antenna

Im rebuilding the phaseing delay lines for my KLM amateur satellite yagis and need to located a source to acquire about ten feet of RG-302 75 ohms and ten feet of RG-303 50 ohms, teflon coax cable.

RG-302 & RG-303 both have teflon dielectric and a silvered copper shield, both have inner conductors of silver-plated copper-plated steel. They are designed for high-temperature operation. I suspect they were selected by the antenna manufacturer because of low temperature coefficients. I don't want to use Radio Shack 75 ohm TV cable.

Different velocity factors between teflon and polyethylene.

polyethylene = 66.5% teflon = 69%

KLM sells the complete phaseing kit replacements for $49 each, however I feel I should be able to replace just the coax for at least half that price.

If anyone knows of a source for RG-302 & RG-303, please post here or reply via eMAIL direct.

Thanks and 73s,
Tom - WB7ASR... (not speaking for Intel)

I have the LKM satellite antenna pair for 2 meters and 70 cm. The two meter cross yagis are feed using the outer/inner coax swapping method, however the 70 cm cross yagis use the insertion of an electrical 1/2 wavelength delay line in series with one of the driven elements.

Which method is better? Why?

Tom WB7ASR

: >time with the proper battery.

: You aren't going to be able to get a GPS and cell phone for a couple
: hundred dollars. The cheapest GPS receivers are around $400, and so
: are cell phones unless you roll their cost into a long term service
: contract. And monthly and per minute cell phone charges will mount
: up fairly rapidly. By using packet radio, amateur or commercial,
: you can send position updates on a regular basis without incurring
: quite as much cost.

: DeLorme Mapping and City Streets are a couple of commercial map
: systems that work with GPS. However, APRS (Automatic Packet Reporting
: System) is in some ways better. While it lacks the friendly user
: interface of the commercial products, and it's pre-made map databases
: are skimpy, you can make your own maps, and it works with local and
: remote GPS receivers (using packet UI frames for the latter). It also
: supports other information about the remote sites such as range and
: bearing data from DF equipment, and arbitary text messages.

: However, what many of us want is *differential* GPS. The Coast Guard,
: FAA, and others send out position deltas from a fixed benchmark
: receiver that are received and used to correct the reading of the local
: GPS receiver. These transmissions are either at MF or VHF depending on
: the system. A special receiver is required, and either a GPS receiver
: designed to work with differential signals, or a PC that can take the
: timestamped position reports and reconcile them via software, is used
: to give a true position. This method removes the deliberate SA jitter,

: and other error sources such as varying atmospheric propagation factors,
: from the position data. This allows much greater precision in determining
: location than raw GPS alone.

: It would be nice if the APRS author would support this mode in his
: software. Some of us are willing to set up benchmark receivers on
: the amateur bands. That timestamped data could be used to correct
: the positions reported by the rover receivers over packet.

: Gary

This has already been done on an experimental basis here in the Annaoplis
area: A cooperating ham otransmits a differential signal on the same
freq as the APRS net. Receive it thru your TNC and it goes into the
GPS receiver. Works fine.

: I have the LKM satellite antenna pair for 2 meters and 70 cm. The two meter
: cross yagis are feed using the outer/inner coax swapping method, however the
: 70 cm cross yagis use the insertion of an electrical 1/2 wavelength delay line
: in series with one of the driven elements.

: Which method is better? Why?

If cost is no object, a transfer relay/switch can swap the connections.
It wouldn't have the problem of additional coax loss, which can be a
factor if you want to hear really well on 70 cm and above without
a preamp for each dipole. I suspect that KLM couldn't find cheap
relays that could do the coax swapping method at 70 cm, though I'm sure
you could get any of the relay companies to design what you need if you
had enough $$$. I've not heard of any amateurs building their own
UHF transfer relays.

From: jackson@longlast.cs.nyu.edu
Message-ID: <330c4k$b19@thecourier.cims.nyu.edu>
Source record: 26957

I just got back from our library with a 300+ page book entitled "Satellite Communications" dated 1993. I've been hooked on them ever since I picked up a PCTrak 3 a couple weeks ago.

Any suggested readings for amateur uses of these satellites?

I have been following AO-13 specifically because of the amount of time covered by mutual visibility with San Francisco.

I'm mostly interested in knowing what kind of services they offer.. store and forward? real-time QSO's? what about imaging? satellite-to-satellite links for real time chats?

any help would be greatly appreciated

I just received my copy of the July/August 1994 issue of THE AMSAT JOURNAL.
In the journal, pages 6-9, they talk about a new Windows PB and PG like
program by ZL2TPO. The program also has a fully intergrated color graphic
world map showing satallite positions and foot prints. It has full support
for the Kansas City Tracker/Tuner, with the optional Windows program by
KC6WYG, on page 10.

Both programs can be purchased from AMSAT direct for $40.00 @ 301-589-6062
All proceeds go to the Phase3D program.

1306. Satellite tracking and Mean Anomaly

Newsgroup: rec.radio.amateur.space
Date: 1994-08-19 03:02:05 UTC
From: david@pitvax.xx.rmit.edu.au
Message-ID: <3317jp$443@aggedor.rmit.EDU.AU>
Source record: 26958

I have been using PCTrack 3 as my first tracking program and find it useful and accurate but it doesn't tell me anything about mean anomaly (MA). I see from the AMSAT Bulletins that AO-13 for example has various transponder schedules depending on where it is in its orbit from perigee.

I'm wondering if there is an easy way to relate MA to UTC for a particular bird? Or do 'better' tracking programs track MA as well as position/footprint? What about the programs sold by AMSAT? I'm not a member of AMSAT-Aust. yet but have the information and plan to sbscribe soon.

1308. MA question VK3JKP

Newsgroup: rec.radio.amateur.space
Date: 1994-08-19 11:13:33 UTC
From: ken@archie.ti.com
Message-ID: <940819111333@ken_durham.sc.ti.com>
Source record: 27011

The reply function wouldn't work, so I'll just post this:

AMSAT offers a tracking program that will give you MA (phase) for a satellite as a function of time. It is called Instantrack and costs $70 for members and somewhat more for non-members.

MA is the satellite orbit phase in units from 0 to 256 which corresponds to 0 to 360 deg. One orbit is MA 256 or 360 deg. (180 deg. = MA 128 and so on.)

The program also tells you the mode (if you keep the schedule updated.)

Looking forward to a QSO with you on AO-10 or AO-13.

1309. Low Orbit transmitter needed!

Newsgroup: rec.radio.amateur.space
Date: 1994-08-19 21:02:54 UTC
From: lucifer@teleport.com
Message-ID: <lucifer.27.00150CF9@teleport.com>
Source record: 27013

Please respond via EMAIL.

FOAF, along with others, may attempt to build a home-brew solid-fuel
rocket capable of reaching a brief low-altitude orbit.
As part of a "prank" he wants to include a tiny transmitter that could be
picked up on the ground. Obviously it has to be extremely tiny, lightweight,
and foolproof.
The transmission could be any type of code that would be interpreted as
15 numbers ranging from 0-9/
Also it has to be DIRT CHEAP or free.

Where would somebody find expertise for such a project?

If the cost of the rocket components is low enough, more than one
transmitter could be needed (eventually).

1310. Two-Line Orbital Element Sets (TLE453)

Newsgroup: rec.radio.amateur.space
Date: 1994-08-19 22:11:18 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.777334278@afit.af.mil>
Source record: 27015

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

1311. satellite tracking for X?

Newsgroup: rec.radio.amateur.space
Date: 1994-08-20 02:48:26 UTC
From: jeppe@clinet.fi
Message-ID: <jeppe.777350906@zetor.clinet.fi>
Source record: 27012

Does anyone know if there is a satellite tracking program for X-windows
that shows the satellite and its coverage over a map in real-time?
(Like Traksat, STS+ and zillions of other tracking programs for dos)

Instead of picking up the 300 page book, you should have gotten
the excellent AMSAT publication on how to use amateur radio
satellites. AO-13 is primarily a random QSOs bird, and an excellent
choice for trans-continental communications. You will need a dual
band (2 meter 70 cm.) all mode (e.g. SSB) tranceiver with a directional
antenna system. Check out my previous posts for information on the
handbook and AMSAT's address for ordering

DOVE-OSCAR-17 STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 232.01 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 20, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-232.01

DOVE-OSCAR-17 (DO-17) Status Report

After extensive development and testing on the ground, another in a series of planned software and hardware tests was activated in the DOVE (DO-17) satellite on 8/3/94 at about 04:40 UTC.

This software sends ASCII telemetry for 90 seconds, then a sequence of 8 tones from the on-board digital-to-analog converter (DAC) followed by three repetitions of the "Hi this is DOVE..." phrase from the voice synthesizer. There is also a new line of status information sent occasionally for test and debugging purposes called VSTAT. It contains data useful to developers and engineers. The purpose of this software is to test the DAC, the two way connection between the 68HC11 processor in the DOVE module and the V40 main processor in the computer module, and various software components and techniques.

The sequence of tones is created by sending digital values to the DAC that generate a pseudo sign wave. It is not intended to simulate a musical scale. However, the tone frequencies do span the nominal audio frequency range of the modulator/transmitter string so they can be used to measure frequency response of the spacecraft hardware.

While DOVE may not sound much different to listeners, hardware components never before activated are in use, along with new software techniques essential to the full exercise of DOVE's capabilities. It is worth noting that some of the hardware used in this test has been idle for 4 1/2 years in space, yet worked perfectly the first time.

With this critical test successfully completed, the development and operations team expects continue to expand DOVE's capabilities.

[The AMSAT News Service would like to thank WD0E and the DOVE Team for this bulletin item.]

PHASE-3D Spacecraft Integration To Has Begun

Dick Jansson, AMSAT-NA's Vice President for Engineering, announces that progress preparing the Phase 3D spaceframe to receive its various modules is progressing well. He adds that one of the recent factors which greatly assisted this progress was the visit of Konrad Mueller DG7FDQ to the Orlando, Florida Integration Facility. Dick said that Konrad was a tireless worker during his short stay in Orlando, not getting any time to visit the beach or even Disney World. Those American "slave drivers" kept his attention glued to the Phase-3D task, Jansson commented. One of the last of the tasks completed, before departing for the airport for his trip home, was the bonding of final two equipment panels and heat pipes to the main structure.

AMSAT-NA President Bill Tynan (W3XO) comments that we greatly appreciate the corporation of AMSAT-DL in loaning Konrad Mueller to us so that this vital work could be accomplished in record time and with the high quality required in the construction of the Phase-3D satellite.

Phase 3D Presentations at the Surrey Satellite Conference

Last week's ANS bulletins presented summaries of some of the papers presented at the International Amateur Satellite Conference held at the University of Surrey in England between July 29 and August 1. This week's bulletin includes more of the material presented on Phase-3D.

One interesting features presented on Phase-3D was in a paper by Dr. Karl Meinzer DJ4ZC and read by Peter Guelzow (DB2OS). It concerned the "LEILA". LEILA is a German acronym but basically it is an "anti-alligator device." LEILA is designed to seek out extra strong signals in the passband. It will initially transmit a Morse warning to the offender telling him or her to reduce power. If that goes unheeded, it will insert 18 dB of attenuation on the frequency of the offending signal. It was stated that LEILA will be able to handle up to five such notches simultaneously.

Peter also discussed the two RUDAKs computer planned for Phase 3D-RUDAK-E and RUDAK-U. The "E" stands for experimental and the "U" for users. RUDAK-U will use AX25 pacsat protocols with six uplinks and one or two down-links at 1200 and 9600 bps, and perhaps faster. The ramdisk should be 16 to 32 MBits. A mailbox is expected. RUDAK-E, similar to the computer on

AO-21, and is intended to support experiments with DSP front-ends for software modems at low and medium speeds such as 1200, 9600 and 19200 bps. Also on the cards is a regenerative modem faster than 64 Kbps and possibly one modem at about 500 Kbps. This will probably use 2400 MHz for one of the links and require 10 Watts of output from P3D and a 1 meter dish for the ground user.

In his talk, G6GEJ presented details on the 2M transmitter he has been building for Phase-3D. It is designed to operate from the 10.7 MHz I.F and uses conventional linear amplification. Mike impressed the group with the prototype of the unit, which he displayed at the meeting.

Hans van Groenendaal ZS5AKV described the 10 meter transmitter being designed and built in South Africa. It will use Compatible Amplitude Modulation (CAM) so that it can be received on simple short wave radios. Transmissions are to consist of 15 minutes of digitally generated audio. The system is intended mainly for educational purposes. It was noted that test transmissions from ZS6SRL using CAM can be heard on 10.125 MHz at 0800 UTC and 1700 UTC Mondays. The signal is beamed toward Europe.

WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 232.04 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 20, 1994
TO ALL RADIO AMATEURS BT
BID: $ANS-232.04

Weekly OSCAR Status Reports: 20-AUG-94

AO-13: Current Transponder Operating Schedule:
M QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Jul 11 - Sep 12
Mode-B : MA 0 to MA 90 | Omnis : MA 230 to MA 30
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 122 |<- S beacon only
Mode-S : MA 122 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 | Move to attitude 230/0, Sep 12
==========
N QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Sep 12 - Dec 19
Mode-B : MA 30 to MA 150 |<- OFF Oct 22 - Nov 07 for eclipses
Mode-B : MA 150 to MA 190 | max duration 2h 12m
Mode-BS : MA 190 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-B : MA 230 to MA 30 | Alon/Alat 230/0
Omnis : MA 250 to MA 140 | Move to attitude 180/0, Dec 19
The battery charge state is of paramount importance during the eclipse seasons. As always the command team may have to have to make temporary changes to the published schedule. In that case we will try to minimize

the inconvenience, setting Mode-B OFF from MA 230-256 in the first instance.

==========

[G3RUH/DB2OS/VK5AGR]

RS-10: NO1R has been enjoying RS-10's Mode A operation at his QTH near Boston. On several mid-Atlantic passes he has worked and confirmed G3ASM in grid square IO94 and F9HR in grid square JN18 near Paris. Robert (F9HR), appears to be very active and NO1R has heard him on both morning and evening passes. Last week, DH5ROB/TF, answered his CQ from Iceland. NO1R used to pass up these low angle mid-Atlantic passes, but now he has worked some of of his best DX on these passes. NO1R also adds that all these DX contacts were done using CW. [NO1R]

AO-16: AO-16 is up and running well. [WH6I]

KO-25: WH6I reports that KO-25 is up and running. He is having some trouble getting reliable data from it, however, and can't seem to find the problem. It's either in the bird, or he feels that he has got some new local interference on the downlink frequency. He is still checking. [WH6I]

KO-23: KO-23 On-Board-Computer (OBC) software crashed about one week ago. The engineers at the KAIST are currently downloading memory images for debugging purposes. Software reloading and packet service will not be carried out until the code dump process finished, which hopefully be completed by next Tuesday. [Hyungshin Kim (hskim@casaturn.kaist.ac.kr)]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ N0QCU. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

Source record: 27021

FOR SALE:

Yaesu FT-290 RII 2 Meter All-Mode Transceiver
- DTMF Microphone
- 25 Watt Amplifier
- Mobile Mounting Bracket (never installed)

This rig is in perfect condition. I purchased it for
the Spring VHF Sweeps and have used it about 6 times
since then. The receiver section and audio on this
rig are excellent, and the SSB is exceptionally sweet.

Unfortunately I must part with it for financial reasons.

The first $450 takes it away.

Low Earth Orbit Satellite System used in Voyage to
North Pole - US/Canada Arctic Ocean Section '94

Today, August 22nd, 1994, the USCG icebreaker POLAR SEA and the
Canadian CG icebreaker LOUIS S. ST-LAURENT, in conjunction with
the Arctic Ocean Section 1994, succeeded in reaching the geographic
north pole.

The voyage was conceived to provide support to a joint US/Canada
environmental and scientific research program in the Arctic Ocean.
The project involves over 60 scientists studying the role of the Arctic
Ocean in relation to changes in regional and global climate and
environment. The two vessels left the Chukchi Sea in late July,
through areas of the Arctic Ocean that never before had been transited
by ship due to the severe sea ice regimes found there.

A number of systems were used in providing communications support
to the Canadian icebreaker ST-LAURENT, including a 56Kbp/s
INMARSAT link. However, after moving outside of the INMARSAT
Pacific Ocean Region satellite footprint at approximately 80 degrees
latitude north, it was UoSAT 3 that provided the primary means of
transferring ice imagery files so critical to ice navigation. Radio
Amateurs will remember UoSAT 3 as UO-14 when it was operated in
the Amateur service, where this technology was largely pioneered. We
believe this to be the first shipboard application of LEO store-and-
forward communications in an operational scenario.

The Canadian Coast Guard would like to thank the Canadian Centre
for Marine Communications in St. John's Newfoundland, as well as
SatelLife of Cambridge, Mass., the Telemedicine Centre of Memorial
University of Newfoundland, and the Centre for Satellite Engineering
Research of the University of Surrey, U.K. for their support in this
program.

1319. Portable EME Station -- Questions

Newsgroup: rec.radio.amateur.space
Date: 1994-08-22 21:39:04 UTC
From: btoback@netcom.com
Message-ID: <btobackCuyHH5.Hw4@netcom.com>
Source record: 27023
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.homebrew

I hope that one of these will be the correct newsgroup for this question; advice on redirection is welcome.

I'm thinking of assembling a portable EME station that I could use for demonstrations at schools. I don't know if such a thing is possible at any reasonable cost, or for any reasonable definition of "portable." But here are the questions anyway:

1. I assume that because of my Arizona location, I can't use 432MHz. This seemed to be the best compromise between power amplifier practicality and antenna size. Is 23cm a good second choice?

2. Assuming that 23cm is a good second choice, how can I generate the necessary power on that band? I've found one amplifier design, in the 1975 (!) ARRL Handbook. It uses a pair of 3CX100A5 tubes and could be used for 200W continuous or 400W intermittent. Since the antenna will be compromised for portability's sake (no 24-ft dishes), I'd like to get more power than this. Has the state of the art improved since 1975? If so, where can I find construction information?

3. Various publications have stated that Yagi designs have proven unsatisfactory for EME work at 23cm, but don't say why. I can make guesses (losses in the splitter network, etc.), but don't know for sure. Is it in fact possible to use these for 23cm EME work? A back-of-the-envelope calculation suggests that a 24dBi array could be quite practical, but I haven't considered splitter network losses.

4. If a Yagi array really can't be made practical, does anyone know of some portable dish designs -- 4m or so? The dish doesn't have to be rugged or able to stand up to weather since it will never see a permanent installation.

The objective is a station that can hear its own echoes -- not necessarily with communication-capable quality -- and can communicate with a "big gun" EME station. If my planning is going in a completely fruitless direction for such an objective, I'd like to know early on!

Thanks,
-- Bruce Toback

1320. Northeast Space Development Conference

Newsgroup: rec.radio.amateur.space
Date: 1994-08-22 21:54:52 UTC
From: ai181@freenet.buffalo.edu
Message-ID: <CuyI7H.E0z@freenet.buffalo.edu>
Source record: 27024

YOU ARE INVITED TO THE PREMIER SPACE CONFERENCE EVENT
IN THE NORTHEAST FOR FALL 1994!

The Northeast Space Development Conference is scheduled for Saturday, September 24, 1994. It will be held on the campus of Rensselaer Polytechnic Institute (RPI) in Troy, New York. The Rensselaer Space Society is sponsoring the use of campus facilities and meeting amphitheaters. Seating for up to 300 persons is available for conference sessions and exhibits will be setup in an adjacent, public access display hall. Propulsion hardware, literature and other items of interest will be shown including displays covering high power and experimental rocketry. Other sponsors of the conference are the National Space Society and its Northeast Chapters, the International Space University, ETM/Solar Works and Space Delivery Systems.

The theme of this conference will be:
"PROGRESS IN COMMERCIAL SPACE DEVELOPMENT"

The Northeast Space Development Conference's primary goal is to offer a meeting place for people from aerospace companies, universities, organizations, government agencies and other individuals who either contribute, participate or otherwise support Commercial Space Development in the Northeast region and across the United States and Canada. We hope to do our part in the Northeast to assure the continued growth of the Commercial Space Industry by offering a highly visible, technical and business level forum to try and focus more regional and national media attention on commercial space endeavors. We feel it is critical to encourage new commercial space ventures and partnerships. This unique conference will hopefully spawn new business and academic relationships, and provide information on the opportunities for cooperation between established and newer space businesses.

We are looking forward to having you become a regular participant in the Northeast Space Development Conference.

NORTHEAST SPACE DEVELOPMENT CONFERENCE - NSDC '94
Darrin Communications Center, Rensselaer Polytechnic Institute, Troy,NY
PROGRAM, SPEAKERS, TIMES (VER. 1.2)

September 24, 1994

REGISTRATION - (8:00am-9:00am)
Continental Breakfast - Display Hall/Lounge Area (until 8:50am)

INTRODUCTION - (8:55am-9:00am)
Conference Chair - Chris Welty

KEYNOTE ADDRESS - (9:00am-9:30am)

PROGRESS IN COMMERCIAL SPACE DEVELOPMENT
Keynote Speaker - Robert Walker, Rep. - PA *

SESSION I - (9:30am-10:30am)

TECHNOLOGY ACCESS & PAYLOAD PROTECTION
- Al Halstead, Introductions
NASA's Technology Reinvestment Program
- Glenn Wright, NASA OACT/CTC *
Satellite & Launch Insurance Update
- Jeffrey S. Cassidy, US Aviation Underwriters

SESSION II - (11:00am-12:00pm)

SMALL LAUNCH VEHICLES & NEW LAUNCH OPTIONS
- Dean Oberg, Introductions
Hot Topics: Launch Vehicle Options (LLV, SS-25, Orbex)
- Peter Diamandis, CTA, Inc.
Space Access by Conversion: New Solid Propellant Launchers
- Robert Davis, E'Prime Aerospace Corp. *

LUNCHEON - (12:30pm-1:30pm) (Chris Welty - Introductions)

Luncheon Talk - PROGRESS IN SPACE BUSINESS EDUCATION
Luncheon Speaker - Robert Richards, International Space University

SESSION III - (2:00pm-3:00pm)

EXPERIMENT CARRIERS & MICROGRAVITY RESEARCH
- Al Halstead, Introductions
Spacehab Progress: Docking Missions to MIR
- David Rossi, Spacehab, Inc.
Progress in Biotechnology & Crystal Growth Research in Space
- Wesley Hymer, PennState University

SESSION IV - (3:30pm-4:30pm)

PROPULSION SYSTEMS & SOLO SPACEFLIGHT
- Dean Oberg, Introductions
Rocket Propulsion Progress - Hybrid Technology Option Project
- Brian Hughes, AMROC, Takoma Park, MD Office *
SPACECUB: A One Passenger Sub-Orbital Rocket
- Geoffrey A. Landis, NASA Lewis Research Center
and David Burkhead, University of Akron

SESSION V - (5:00pm-6:00pm)

SUNSAT ENERGY & LUNAR COMMERCE
- Gay Canough, Introductions
Progress in Solar Power Satellites
- Seth Potter, New York University *
Commercial Lunar Rover - Advanced Robotics
- David Gump, LunaCorp, Arlington, VA

* invited

SPACE ENTREPRENEURS POST CONFERENCE DINNER

As a follow-on function a cocktail half hour and a dinner gathering will be held at the Castaways Restaurant which is across the street from the Super 8 Motel (close to RPI).

COCKTAILS - (6:30pm-7:00pm)
- Cash Bar & opportunity to visit and socialize with other attendees, associates and speakers
INFORMAL "Dutch Treat" DINNER - (7:00pm-?)
- Fine food and discussion of the days events.

Subject: New satellite Windows programs
To: ham-space@ucsd.edu

I just received my copy of the July/August 1994 issue of THE AMSAT JOURNAL.
In the journal, pages 6-9, they talk about a new Windows PB and PG like
program by ZL2TPO. The program also has a fully intergrated color graphic
world map showing satallite positions and foot prints. It has full support
for the Kansas City Tracker/Tuner, with the optional Windows program by
KC6WYG, on page 10.

Both programs can be purchased from AMSAT direct for $40.00 @ 301-589-6062
All proceeds go to the Phase3D program.

: >time with the proper battery.

: You aren't going to be able to get a GPS and cell phone for a couple
: hundred dollars. The cheapest GPS receivers are around $400, and so
: are cell phones unless you roll their cost into a long term service
: contract. And monthly and per minute cell phone charges will mount
: up fairly rapidly. By using packet radio, amateur or commercial,
: you can send position updates on a regular basis without incurring
: quite as much cost.

: DeLorme Mapping and City Streets are a couple of commercial map
: systems that work with GPS. However, APRS (Automatic Packet Reporting
: System) is in some ways better. While it lacks the friendly user
: interface of the commercial products, and it's pre-made map databases
: are skimpy, you can make your own maps, and it works with local and
: remote GPS receivers (using packet UI frames for the latter). It also
: supports other information about the remote sites such as range and
: bearing data from DF equipment, and arbitary text messages.

: However, what many of us want is *differential* GPS. The Coast Guard,
: FAA, and others send out position deltas from a fixed benchmark
: receiver that are received and used to correct the reading of the local
: GPS receiver. These transmissions are either at MF or VHF depending on
: the system. A special receiver is required, and either a GPS receiver
: designed to work with differential signals, or a PC that can take the
: timestamped position reports and reconcile them via software, is used
: to give a true position. This method removes the deliberate SA jitter,
: and other error sources such as varying atmospheric propagation factors,
: from the position data. This allows much greater precision in determining
: location than raw GPS alone.

: It would be nice if the APRS author would support this mode in his
: software. Some of us are willing to set up benchmark receivers on
: the amateur bands. That timestamped data could be used to correct
: the positions reported by the rover receivers over packet.

This has already been done on an experimental basis here in the Annaoplis area: A cooperating ham otransmits a differential signal on the same freq as the APRS net. Receive it thru your TNC and it goes into the GPS receiver. Works fine.

In a recent rec.radio.amateur.space article Tom
(tom_boza@ccm.hf.intel.com) wrote about an article in the July/August
issue of THE AMSAT JOURNAL, in which it talked about a Windows prog. It
has full support for the Kansas City tracker/tuner , wtc, wtc.

Windows PB and PG can be purchased from AMSAT direct for $40.00 @
301-589-6062. All proceeds go to the Phase3D program.

Hope this helps.

|>be heard. Its a shame, because 20 watts with a vertical is really all you need.
|>
|>Tom WB7ASR...
|>

I think that is a slight overstatement. Mobiles get in on a regular basis
and few if any are running 40+ elements. On the other hand, you are correct
that if the others won't stand by to let you in, you won't capture the
satellite's receiver. This is an unfortuante case on the satellites where
the big gun always wins.

1328. KIDS AND SPACE

Newsgroup: rec.radio.amateur.space
Date: 1994-08-24 23:27:20 UTC
From: swteegar@winward.win.net
Message-ID: <257@winward.win.net>
Source record: 27029

Greetings one and all....

A year ago when I was busy doing the SAREX thing in Hawaii, I wrote this "Story" of sorts. I write a fair amount, but this one seemed to be accepted by alot of people in education and in the Space Program. I thought I'd share it with all of you in hopes that it inspires you to think about Space and Kids and what maybe YOU can do to help...

Comments are always welcome as are thoughts on what more we can do as hams (And non Hams) to inspire kids to dream about space and the "Big Picture"....

Aloha,

Steve W. Teegarden
WH6IC

****
SPACE...

In the travels of my life, I have enjoyed walking the quiet sands of Time, and seeing the beauty of crystal clear water as it slowly builds to a wave,then to a horizon, then to a world of oceans.....

I have heard the sounds of Canadian geese as they navigate to the warmer regions of our world flying only by instinct and god's gift of flight....

I have spoken in quiet words to those that could not speak, and I have listened to their sounds, that only the soul can hear...

But I have never seen a sight like that of a child's face when the only sounds are stars from the distance galaxies above and the glowing of planets smiling down on earth...

Alas, I have found a way in my life to show others
the vision of what I see.... and to help them hear those sounds that only the mind can understand....

I have had the chance to see this child look into the vast depths of space and ask only one thing......

Can you teach me ?

12-JULY-1993

An inspiration to us all, this vision of a child
as they look into the heavens.May we never forget
that teaching is in fact the extension of the spirit
to go beyond that which do not understand .....

Steve W. Teegarden

To: ham-space@ucsd.edu

My first AO-13 contact was with KC0TO/7 in Wyoming on 30 July at 0607 UTC.

He gave the QSL route, but I misplaced it.
My card to the callbook address for KC0TO was returned undeliverable.

Does anyone have the correct QSL route?

Subject: New satellite Windows programs
To: ham-space@ucsd.edu

I just received my copy of the July/August 1994 issue of THE AMSAT JOURNAL.
In the journal, pages 6-9, they talk about a new Windows PB and PG like
program by ZL2TPO. The program also has a fully intergrated color graphic
world map showing satallite positions and foot prints. It has full support
for the Kansas City Tracker/Tuner, with the optional Windows program by
KC6WYG, on page 10.

Both programs can be purchased from AMSAT direct for $40.00 @ 301-589-6062
All proceeds go to the Phase3D program.

1335. Re: satellite tracking for X?

Newsgroup: rec.radio.amateur.space

Manfred Bester's UNIX SatTrack is available at ftp.jvnc.net in
/priv/kupiec. It tracks satellites in real-time on a VT-100 compatable
terminal.

The only satellite trackers for X are: (are there any others?)

Source for these can be obtained at various sites. (use archie)

Xsat: Makes PostScript maps of satellite tracks.
Xephem: Tracks planets/stars in real-time, satellites can also be tracked.
(A Linux binary of Xephem is available at the site mentioned above.)
SFS: (Space Flight Simulator) Tracks satellties / moon / planets with
views from many perspectives. Near real-time.

Hope this helps.

1336. Two-Line Orbital Element Sets (TLE458)

Newsgroup: rec.radio.amateur.space
Date: 1994-08-26 23:09:40 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.777942580@afit.af.mil>
Source record: 27039

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) *253-9767*, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

TO ALL RADIO AMATEURS BT
BID: $ANS-239.01

STS-64 SAREX Update

The next Shuttle Amateur Radio Experiment (SAREX) mission is now less than two weeks away. The STS-64 Space Shuttle Discovery Mission, tentatively scheduled for launch on September 9, will carry SAREX voice and packet radio on a 9 day mission. More details on the upcoming SAREX flight are described in the detailed information sheet below.

STS-64 Shuttle Amateur Radio Experiment (SAREX)
Information Sheet

Mission:STS-64 Space Shuttle Discovery
Lidar In-Space Technology Experiment (LITE-1)
SPARTAN-201
Robot Operated Materials Processing System (ROMPS)

Launch:September 9, 1994, 20:30 UTC

Orbit:57 degree inclination

Mission Length:9 days (Nominal)

Amateur
Radio
Operators:Dick Richards, KB5SIW, Commander, Blaine Hammond, KC5HBS,
Pilot, and Jerry Linenger, KC5HBR, Mission Specialist

Modes:FM Voice
Prime callsign: KB5SIW

Packet Radio
Callsign: W5RRR-1

Frequencies:All operations in split mode. Do not transmit on
the downlink frequency.

Voice Freqs:Downlink:145.55 MHz (Worldwide)
Uplinks:144.91, 144.93, 144.95, 144.97, 144.99 MHz
(Except Europe)

144.70, 144.75, 144.80 MHz (Europe only)

Note: the crew will not favor any specific uplink
frequency, so your ability to work the crew will
be the "luck of the draw"

Packet Freqs:Downlink:145.55 MHz
Uplink:144.49 MHz

Info:Goddard Amateur Radio Club, WA3NAN, Greenbelt Maryland,
SAREX Bulletins and Shuttle Retransmissions
3860 KHz, 7185 KHz, 14,295 KHz, 21,395 KHz, 28,650 KHz
and 147.45 MHz (FM)

ARRL Amateur Radio Station, W1AW, Newington, CT
SAREX News Bulletins
3990, 7290, 14,290, 18,160, 21,390, and 28,590 KHz
and 147.555 MHz (FM)

:Also, bulletins available on internet, via AMSAT ANS,
Compuserve, and your local PBSS.

School Group Participation: 10 school groups will participate
in SAREX with pre-scheduled direct
and telebridge contacts. These include
nine in the U.S., and one in New Zealand.
Prelaunch Keplerian Elements:

These are the Keplerian elements for STS-64 mission, rotated to the
current planned launch time of Sep 9 at 20:30 UTC. The JSC-005 epoch
is at the start of orbit 5, after the trim burns on orbits 3 and 4. The
negative drag fit was required to match the design trajectory because there
is a 6.5 fps trim burn on orbit 28. The phasing and circ burns on orbit 99
lower the altitude by about 8 n.mi, so the second element set JSC-006 is
required after that. These Keps are provided by Gil Carman, WA5NOM
at the Johnson Space Center ARC.

Weekly OSCAR Status Reports: 27-AUG-94

AO-13: Current Transponder Operating Schedule:
M QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Jul 11 - Sep 12
Mode-B : MA 0 to MA 90 | Omnis : MA 230 to MA 30
Mode-BS : MA 90 to MA 120 |
Mode-S : MA 120 to MA 122 |<- S beacon only
Mode-S : MA 122 to MA 145 |<- S transponder; B trsp. is OFF
Mode-S : MA 145 to MA 150 |<- S beacon only
Mode-BS : MA 150 to MA 180 | Blon/Blat 180/0
Mode-B : MA 180 to MA 256 | Move to attitude 230/0, Sep 12
==========
N QST *** AO-13 TRANSPONDER SCHEDULE *** 1994 Sep 12 - Dec 19
Mode-B : MA 30 to MA 150 |<- OFF Oct 22 - Nov 07 for eclipses
Mode-B : MA 150 to MA 190 | max duration 2h 12m

Mode-BS : MA 190 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-B : MA 230 to MA 30 | Alon/Alat 230/0
Omnis : MA 250 to MA 140 | Move to attitude 180/0, Dec 19
The battery charge state is of paramount importance during the eclipse seasons. As always the command team may have to have to make temporary changes to the published schedule. In that case we will try to minimize the inconvenience, setting Mode-B OFF from MA 230-256 in the first instance.
==========
[G3RUH/DB2OS/VK5AGR]

RS-10: In last week's OSCAR Status Reports NO1R reported that he has made some very spectacular contacts with his very modest Mode-A station arrangement. His station set-up includes a Kenwood TR-751A at 25 watts into a AEA Isopole up about 35 ft. His receiver is the Realistic HTX-100 into an inverted-vee up about 30 ft with an Advanced Receiver Research 10M preamp. This week NO1R reports that he has just received a QSL from Andy Mironov at RS3A confirming my RS-10 Robot QSO in April. Andy also writes: "I will be glad to have any info abt your work via RS: your DX? PSE send by post or packet. 73 Andy" The packet address is for Andy is: RK3KPK@RK3KP.RUS.EU [NO1R]

AO-13: N7RYW would like to pass on a note about the Mode-S transponder. He has noticed that there is one station who continually sweeps the uplink, looking for his downlink signal. This is fine normally, N7RYW says, but as this station starts to increase his power far in excess of what is needed when he is unable to find himself. The net effect of this is that other stations can't hear themselves either because the AGC on the uplink receiver has reduced its sensitivity to compensate for this strong signal. This has the effect of reducing the AGC affects EVERYONES, making it impossible to even hear their own signals! N7RYW has tried to respond to this station CW CQs when it finally does settle down (over 20 minutes one day!), but it does not respond to N7RYW's SSB call. N7RYW says he doesn't have a key, and doesn't want to install one just for just one single lid! All of the Mode-S users N7RYW has talked with are well aware of the power limits for uplinking with this one exception. N7RYW will not single out this person with their callsign, so he hopes a call to him in this way, with as much information as possible, without the call, will get his attention. This problem is ongoing, and serious. A station recently was attempting their first QSO on Mode-S a few days ago, and could not get it done due to this over-powered signal wiping out the trans-ponder. This is definitely NOT radar, which does not start sending CQ CQ CQ DE *****! While it won't help the excess power problem, this item may help people "find themselves." N7RYW has found that the Mode-S transponder's actual downlink appears to be 2400.735 MHz to 2400.765 MHZ, up 30 kHz from those published. N7RYW does not own a signal source with that high of frequency to verify this, but the UO-11 beacon passed zero Doppler within 1 kHz of the published frequency, so N7RYW would like to hear if anyone else has found those frequencies to be more accurate so he can verify and notify!
[N7RYW@teleport.com]

KO-23: N7RYW reports that KO-23 is now back in operation after an OBC crash. The groundstation control elected to do a data dump to try to find the cause of the crash, so it took a few extra days to get the OBC reset. [N7RYW@teleport.com]

KO-25: KO-25 is back in service. Both KITSATs were down at various times for output power tests. These tests appear to be over for now. N7RYW has noticed that when either one is down due to a crash, a peculiar tone is emitted on the transmitter. If you are getting a good signal level, but no data, turn up the volume and listen for this tone. It may save you some head scratching later! Also, on the two KITSATs, the control station usually puts out a notice when one of the sats will not be in regular service. They are usually short notices, and originate from HL0ENJ, so it might be good to mark all messages from this station for automatic downloading in your select files. [N7RYW@teleport.com]

UO-11: The 2401.5 MHz beacon was been heard by N7RYW twice with an unmodulated carrier. On the first occassion he had the polarization set at LHCP, and it was just barely audible. Later he changed to RHCP and the signal was very strong. This polarity change was done on a 6' dish with a horn type feed with dual probes fed 90 degrees apart, much like a crossed dipole. [N7RYW@teleport.com]

AO-16: AO-16 is up and running well. [WH6I]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ N0QCU. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

1339. Looking for Mac program Macsat

Newsgroup: rec.radio.amateur.space
Date: 1994-08-29 14:57:31 UTC
From: poole@uts.cc.utexas.edu
Message-ID: <33st0r$n23@curly.cc.utexas.edu>

A while back, I used a program called Macsat. It predicted times when satellites would be visible. It read the NASA 2-line orbit element format. I'd like to get a copy of that program. Can someone send me the phone # or address of the company that sells it? Thanks.

Hi all

Sort of toying with the idea of radio astronomy in the upper amateur bands, anyone of others who might be doing this ? Or can anyone point me in the direction of some good books if they exist ?

Mac Sat was replaced by a newer program called OrbiTrack. It is written by Bill Bard of:

BEK Developers
PO Box 47114
St. Petersburg, FL 33743-7114

Send him $25 and you'll get the newest copy of the program and a manual or perhaps try Archie (it's shareware)

I use it in my high school physics class and I can attest that it is extremely well written and simple to use. There is an FPU and a non-FPU version. I've been wanting to ask him if he is thinking of complling a Power PC version. Perhaps if you contact him, you could find this out and post it on this newsgroup.

Sorry about the typos, I'm using a clunky editor and don't want to retype whole lines!

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

< Dated information here >

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat

transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

1345. Help wanted with decoding telemetry

Newsgroup: rec.radio.amateur.space
Date: 1994-09-01 08:06:23 UTC
From: u1066579@csdvax.csd.unsw.edu.au
Message-ID: <1994Sep1.180623.2502@csdvax.csd.unsw.edu.au>
Source record: 27048

HI,
I am interested in the possibility of decoding the telemetry from weather satellites. Can anyone help me with this? If so please e-mail.
Best Wishes,
Henry.

1346. Rain attenuation of satellite downlinks

Newsgroup: rec.radio.amateur.space
Date: 1994-09-01 19:46:03 UTC
From: Michael@arkas.demon.co.uk
Message-ID: <778448763snz@arkas.demon.co.uk>
Source record: 27049

This might not be exactly amateur radio, but perhaps there is an avid satellite tv dx'er out there who can help ...

I am interested in obtaining measured rain attenuation figures for C-band downlink (4 GHz) signals from communications satellites in the South-East Asian tropical region. I'm looking to compare typical, real-world attenuation values with those predicted by the CCIR model.

Can anyone point me to where I may find such information? I would prefer an Internet source, but printed references would be ok.

Emailed messages to michael@arkas.demon.co.uk would be appreciated.

TIA & 73's

1347. Mir Checkpoint #734

Newsgroup: rec.radio.amateur.space
Date: 1994-09-02 13:10:01 UTC
From: tstader@aol.com
Message-ID: <347879$o13@search01.news.aol.com>
Source record: 27051

MacSPOC Users-

The enclosed checkpoint reflects tracking of Russia's Mir space station late Wednesday night CDT. Over the past few days, Mir's orbit has been changed repeatedly. A Progress resupply vehicle launched last Friday has made 2 unsuccessful automated docking attempts with Mir, and a third attempt is to be made under manual control from Mir's crew this Friday. Under standard Russian docking procedures, the attempt would be initiated around 8:38 AM CDT Friday.

Fuel reserves aboard Progress are nearly exhausted, although a fourth attempt may be possible. If a docking is not performed, however, Mir would have to be abandoned in about 2 weeks before her crew ran out of food. Without a crew, Mir's fate is unknown. A major reactivation effort was required after Mir's Salyut-7 predecessor was abandoned in 1985.
